Preface

The information presented in this guide is intended for users who are familiar with basic Actifio processes and procedures as described in *Getting Started with Actifio Copy Data Management* and who are qualified to administer Oracle databases.

Your Actifio appliance’s Documentation Library contains detailed, step-by-step, application-specific instructions on how to protect and access your data. Each guide is in PDF format and may be viewed online, downloaded, or printed on demand. The following guides will be of particular interest:

- *Connecting Hosts to Actifio Appliances*
- *Virtualizing and Protecting Copy Data with the Application Manager*
- *Accessing and Recovering Copy Data with the Application Manager*
- *Restoring Copy Data with the Application Manager*

**The ActifioNOW Customer Portal**

During the configuration and initialization of your Actifio appliance your Actifio representative provided you with a user name and password for the ActifioNOW customer portal.

From the customer portal you can obtain detailed reports about your Actifio appliance as well as search the portal’s knowledge base for answers to specific questions.

To log into the ActifioNOW customer portal:

1. Go to: [https://now.actifio.com](https://now.actifio.com)
2. When prompted, enter the user name and password provided by your Actifio representative.

**Actifio Support Centers**

To contact an Actifio support representative, you can:

- Send email to: support@actifio.com
- Call:
  - From anywhere: +1.315.261.7501
  - US Toll-Free: +1.855.392.6810
  - Australia: 0011 800-16165656
  - Germany: 00 800-16165656
  - New Zealand: 00 800-16165656
  - UK: 0 800-0155019
1 Introduction to Actifio Copy Data Management

This chapter provides a high-level overview of basic Actifio concepts and procedures used to capture and access Oracle databases. It includes:

- Capturing Oracle Data on page 2
- Replicating Data on page 3
- Accessing Data on page 4
- Known Oracle Bugs That Affect Actifio Functionality on page 6

**Actifio Data Virtualization**

An Actifio appliance is a highly scalable copy data management platform that virtualizes application data to improve the resiliency, agility, and cloud mobility of your business. It works by virtualizing data in much the same way other technologies have virtualized servers and networks. This enables you to capture data from production systems, manage it in the most efficient way possible, and use virtual or physical copies of the data whenever and wherever they are needed.

**Capture, Manage and Access Application Data**

Application data is captured at the block level, in application native format, according to a specified SLA. A golden copy of that data is created and stored once, and is then updated incrementally with only the changed blocks of data in an “incremental forever” model. Unlimited virtual copies of the data can be made available instantly for use, without proliferating physical copies and taking up additional storage infrastructure.
Capturing Oracle Data

Capturing Oracle data consists of four simple steps:

1. Add servers that host Oracle databases.
2. Discover an Oracle database as an application.
3. Define Actifio Policy Templates and Resource Profiles according to your RPOs and RTOs.

The Actifio Connector

The Actifio Connector is used to capture selected Oracle databases. The Actifio Connector is a small-footprint, lightweight service that can be installed on either virtual or physical servers. The Actifio Connector makes use of Oracle RMAN for capture and access operations.

Specifically, the Actifio Connector:

- Discovers Oracle databases.
- Uses RMAN image copy and incremental merge API to capture data at block level in incremental forever fashion.
- Identifies changes to database data for Actifio’s incremental forever capture strategy.
- Captures and manages archivelog:
  - Captures Oracle database(s) and logs with one SLA.
  - Purges Oracle database archivelog.
  - Rolls forward Oracle database archivelog for point-in-time recovery when accessing virtual copies.

Oracle Database Block Change Tracking (BCT)

Oracle tracking enables fast database backups by identifying which blocks have changed. Only changed blocks are included in the backup operation.

- Actifio incremental-forever supports both databases running with BCT enabled and databases running with BCT disabled.
- Change Block Tracking is enabled at database level.
- Oracle records the changed blocks in each data file in a tracking file (small binary file stored in the database area).
- With tracking enabled, RMAN uses the BCT file to get the changed blocks for incremental backup.
- RMAN scans each block in a data file for all data files in the database during incremental backup when Change Block Tracking on the database is not enabled.
- With BCT not enabled the incremental backup time will increase.

Protecting Oracle Databases in an Actifio Consistency Group

A consistency group can contain only a single Oracle database application and any number of file system applications from the Oracle server. A consistency group is a very good choice if you are managing Oracle databases for test/dev and other business agility purposes.
Replicating Data

Data can be replicated to a second Actifio appliance or to the cloud for recovery, disaster recovery, or test/development purposes.

Data replication has traditionally been an inhibitor to efficient data management in a geographically distributed environment. Actifio replication addresses these issues with a global deduplication and compression approach that:

- Drives down overall network usage.
- Eliminates the need for a dedicated WAN accelerator/optimizer.
- Does not require storage array vendor licenses as data is sent from one Actifio appliance to another.
- Is heterogeneous from any supported array to any supported array: Tier 1 to Tier 2 and/or Vendor A to Vendor B.
- Preserves write-order, even across multiple LUNs.
- Encrypts data using the AES-256 encryption standard. Authentication between Actifio appliances is performed using 1024-bit certificates.

Replication is controlled by Actifio Policy Template policies. Production to Mirror policies have two options to replicate data to a second Actifio appliance:

- Dedup Backup to Dedup DR policies use a fixed, Actifio proprietary replication engine to replicate data to a second Actifio appliance. In addition, Dedup Backup to Dedup DR policies allow you to replicate data to two locations.
- Production to OnVault policies use a fixed, Actifio proprietary replication engine to replicate data to the cloud.
Accessing Data

The Actifio appliance can instantly present a copy of the database rolled forward to a specific point of time. The roll forward operation is performed from the Actifio Desktop (user interface).

Access options include:
- Mounts
- LiveClones
- Restores
- Workflows

Mounts

The Actifio mount function provides instant access to data without moving data. Captured copies of databases can be rolled forward via the Actifio user interface and mounted on any Oracle database server.

An Actifio appliance provides two ways to mount an Oracle database:
- The standard mount presents and makes a captured Oracle database backup image copy available to a target server as a file system or as an ASM Disk group depending on the capture method. This is useful for any tablespace/datafile recovery on source or to make a physical copy on target using RMAN duplicate.
- The Application Aware mount presents and makes the captured Oracle data available to a target server as a virtual Oracle database. This allows you to address the unique challenges associated with creating and managing copies of production databases for non-production use. Application Aware mounts are performed from the Actifio appliance and do not require manual intervention by database, server, or storage administrators. Application Aware mounts can be used for such things as database reporting, analytics, integrity testing, and test and development. Application Aware mounts are described in Mounting an Oracle Database as a Virtual Application on page 48.

LiveClones

The LiveClone is an independent copy of Oracle data that can be refreshed when the source data changes. The advantage of LiveClones is that they are independent copies of data that can be incrementally refreshed and masked before being made available to users. This allows teams such as development and test to ensure they are working on the latest set of data without having to manually manage the data and not access or interfere with the production environment.

Restores

The restore function reverts the production data to a specified point in time. Restore operations actually move data. Typically restore operations are performed to restore a database to a valid state after a massive data corruption or storage array failure. The amount of time required to complete a restore operation depends on the amount of data involved.

Workflows

While SLAs govern the automated capture of a production Oracle database, Workflows automate access to the captured database.

Workflows are built with captured Oracle data. Workflows can present data as either a direct mount or as a LiveClone:
- Direct mounts (standard or application aware) work well for Oracle data that does not need to be masked prior to being presented. A mounted copy of data can be refreshed manually or on automatically on a schedule. Direct mounts allow you to instantly access captured Oracle data without actually moving the data.
- A LiveClone is a copy of your production Oracle data that can be updated manually or on a scheduled basis. You can mask sensitive Oracle data in a LiveClone prior to making it available to users.
Combining Actifio’s automated Oracle data capture and access control with Workflows and their optional data masking capabilities allows you to create self-provisioning environments. Now users can provision their own environments almost instantly.

For example, an Actifio administrator can create an SLA Template Policy that captures Oracle data according to a specified schedule. Optionally, the administrator can mark the captured production Oracle data as sensitive and only accessible by users with the proper access rights.

After access rights have been defined and data has been captured, the administrator can create a Workflow that:

- Makes the captured Oracle data available as a LiveClone or as a direct mount
- Updates the LiveClone or mountable Oracle data on a scheduled or on-demand basis
- (Optional) Automatically applies scripts to the LiveClone’s Oracle data after each update. This is useful for masking sensitive Oracle data.

Once the Workflow completes, users with proper access can provision their environments with the LiveClone or mountable Oracle data via the Actifio Desktop.

**Workflow With Masked Social Security Data**
Known Oracle Bugs That Affect Actifio Functionality

These are known Oracle bugs that can occur in an Actifio environment:

**Actifio Tracking 50661: Oracle Standalone ASM backups failing with error ”Failed to create ASM staging disk group” :**
Oracle Version Affected: 11.2.0.1
Oracle Standalone ASM backups failing with error ”ORA-15238: 11.2.0.1.0 is not a valid value for attribute compatible.asm.” Upgrade to 11.2.0.4 or higher.

**Oracle Bug On IBM AIX on POWER Systems (64-bit) ORA-00449**
Background process ‘MMON’ unexpectedly terminated with error 448 (Doc ID 2111305.1)
Oracle Version Affected 12.1.0.2 to 12.1.0.2
Actifio Application Aware Mount may fail if the Patch 23089357 is not applied.
Apply Patch 23089357: APPSST12102:SHUTDOWN FAILS WITH ORA-449 “BACKGRND PROCESS ‘MMNL’ UNEXPECTEDLY

**Oracle Bug 13366202**
DBNEWID [ nid ] does not allow TARGET=/ (NID-106) (Doc ID 13366202.8)
Oracle Version Affected: 11.2.0.3
Actifio Application Aware mounts may fail if Oracle database 11.2.0.3 install does not include Patch 13366202.

**Oracle Bug 8579188**
RMAN RESTORE COMMAND FAILED WITH ORA-1861 (RMAN Recovery Session Fails with ORA-1861 (Doc ID 852723.1))
Oracle Version Affected: 10.2.0.1 to 11.2.0.1
Actifio Application Aware mounts may fail for Oracle database 10.2.0.1 to 11.2.0.1.
Fixed in: 11.2.0.2

**Oracle Bug 9216848**
On AIX 6.1 64bit Power 7 Opatch Fails In $ORACLE_HOME/jdk/jre/bin/libj9jit23.so (Unhandled Exception Type=Segmentation ErrorVmstate=0x00000000 J9Generic_Signal_Number=...) (Doc ID 1307620.1)
Oracle Version Affected: 11.1.0.7
Apply Patch: 9216848

**Oracle Bug 19621704**
Oracle Database - Enterprise Edition - Version 11.2.0.1 to 12.1.0.2 [Release 11.2 to 12.1]
ORA-00600 [723] [memory Leak] Error With Leaked Memory For ”mbr node memory” (Doc ID 1944511.1)
Actifio Application Aware mounts may encounter a memory leak issue if patch 19621704 is not applied.
Apply Patch: 19621704

**Oracle Database 12cR1 Bug 18845653**
ORA-600 from PDB close if PDB renamed in another session [18845653.8]
Bug 19075256 - ORA-600 [kcfmis_internal: enq] from PDB RENAME [19075256.8]
This can happen on Actifio created copy for test/dev if PDB rename operation is executed. Fixed in: April 2017 DB PSU
**Oracle Database 12cR1 Bug 19404068**
(ORA-1610 ON RECOVER DATABASE FOR CREATED CONTROLFILE)

**Oracle running on Unix systems:**
Actifio Application Aware mounts may fail if your Oracle 12c installation does not include Patch# 19404068 for 12.1.0.2.0
Oracle version affected: 12.1.0.2.0
Apply Patch: 19404068

**Oracle running on WINDOWS systems:**
Actifio Application Aware mounts may fail if your Oracle 12c installation does not include Patch# 22809813 for 12.1.0.2.0
Oracle version affected: 12.1.0.2.0
Apply Patch: 22809813

Oracle Patch release notes: https://updates.oracle.com/Orion/Services/download?type=readme&aru=20122528#BABCGCAB

**Oracle Bug 13037524**
Querying v.asm_disk from database instance raises ORA-01455: converting column overflows integer datatype (Doc ID 1473647), caused by Oracle unpublished Bug 13037524
Confirmed Oracle Version Affected: 11.1.0.6 to 11.1.0.7
Fixed in: 11.2.0.1 and above.
Actifio Oracle backup may fail if Oracle database 11.1.0.6 to 11.1.0.7 install does not include this patch
Apply Patch: 13037524 for 11.1.0.7

**Queries on DBA_FREE_SPACE are Slow (Doc ID 271169.1)**
During Actifio backup, the Actifio Connector queries the dba_free_space Oracle metadata table to determine the database allocated and free space. Sometimes the sql queries to dba_free_space become very costly. This is Oracle known issue Doc ID 271169.1 (Queries on DBA_FREE_SPACE are Slow). This can be observed on a hung system by running ps -ef | grep -i dbFreeSize.sql from the command line.
Oracle recommends to purge the recycle bin from the database. Below are the steps to purge the recycle bin.

1. Login to the database as sysdba:
   `sqlplus / as sysdba
   SQL> purge dba_recyclebin;
   SQL>exit;`
2. It is a good idea to run the statistics on fixed objects. This can take a few minutes.
3. Login to the database as sysdba:
   `sqlplus / as sysdba
   SQL> exec dbms_stats.GATHER_FIXED_OBJECTS_STATS
   SQL>exit;`
Actifio Prerequisites for Protecting an Oracle Database

After the Actifio preparation and before you can protect and restore Oracle databases,

1. Review the concepts in Chapter 3, Oracle Authentication and Chapter 4, Data Capture under File System and under ASM Disk Group,

2. Prepare the database according to the steps in Chapter 5, Preparing Oracle Databases for Protection.

Then you can perform most database protection, access, and recovery operations from either the Actifio Global Manager (AGM) or from the Actifio Desktop on a specific Actifio appliance. This section includes:

Prerequisites when Working from the AGM on page 9
Prerequisites when Working from the Actifio Desktop on page 10

Prerequisites when Working from the AGM

</tbody>
</table>
3 Oracle Authentication

This section describes two forms of Oracle database user authentication that you can use from an Actifio appliance:

Using Oracle with OS Authentication
Using Database Authentication for an Oracle Database Server on page 12

**Note:** Actifio RMAN backup runs as Oracle binary owner. If the user running the database instance is different than the Oracle OS owner and the group access privileges for the two users are not the same then the backup will fail.

In an SAP environment, sometimes the Oracle database instance gets started as sapadmin instead of as the Oracle OS owner account. The right configuration is to start and run the database instance as Oracle OS user who owns the Oracle binary. If the database instance is required to run as a different user such as sapadmin then sapadmin and the Oracle OS user should have all the same group access privileges.

Using Oracle with OS Authentication

**Note:** OS Authentication is not supported in Windows environments.

OS Authentication is the default setting in Unix environments. No database user account and no service name are needed. An Actifio backup uses “/ as sysdba” to connect to database.

With OS authentication the backup can not be run in parallel from multiple nodes in a RAC environment using backup under ASM disk group.

From the AGM Application Details and settings, you can validate the authentication configuration, as shown at right.

Required Application Advanced Settings for an Oracle database when OS Authentication is configured are:

- **Number of Channels:** Specify the number of channels for RMAN based on the number of cores on the database server. Consider the number of channels allocated to the other database backup on this server to optimize the channel allocation. The default value is 1 RMAN channel.

- **Oracle Data Guard Primary Node Servicename:** This is required only when you are protecting data from Oracle Data Guard. See Protecting from an Oracle Data Guard Node on page 26. In case of Data Guard, you also need the database username and password to connect to primary to switch the archive log for consistent database copy during the backup.
Using Database Authentication for an Oracle Database Server

Oracle database authentication uses Oracle database credentials. With Oracle Database Authentication, you must provide database credentials to connect to the database with sysdba privilege (or sysbackup for Oracle 12c).

See Oracle Metalink note: Doc ID 469777.1 for sysdba privilege requirement for RMAN backup.

You enter database credentials in the Actifio Desktop, from Application Advanced Settings.

Enabling Oracle Database Authentication

To enable Oracle Database Authentication:

1. Open the Actifio Desktop to the Domain Manager.
2. In the Navigation panel Security section, under Hosts, select the database server to authenticate against.
3. On the Host property page, check the Use Oracle Database Authentication checkbox. The backup will use Database Authentication for all databases on that database server. This requires a database user account under Application Advanced Settings for the backup to succeed.
4. Provide the required database authentication credentials in the Application Advanced Settings under the Application Manager for each database that will be managed from this database server. Additional Application Advanced Settings for an Oracle database are:

- Username and Password
- User Role in the Database

**Note:** By default the user to connect to database is sysdba. In an Oracle 12c environment you can choose sysbackup if the database user is granted sysbackup instead of sysdba.

- Number of Channels
- Oracle Servicename
- Oracle TNS_Admin Path
  - **Oracle Data Guard Primary Node Servicename:** This is required only when you are protecting data from Oracle Data Guard. See Protecting from an Oracle Data Guard Node on page 26.

These are all detailed in Application Advanced Settings for Oracle Databases on page 32.
Oracle database capture has different properties depending on whether the images are protected under a:

**File System**: For all database source database configurations other than Oracle ASM, the backup is under a file system. See Protecting an Oracle Database Under a File System as a File System on page 16.

**ASM Disk Group**: If a source database configuration is using ASM, the backup is under an ASM disk group. The application advanced settings include ASM configuration options that enable the database to be mounted back to an ASM Disk Group. For more information on protecting an Oracle database under an Oracle ASM disk group, see Protecting an Oracle Database Under an ASM Disk Group as an ASM Disk Group on page 16.

During the capture, you can convert the database from one format to the other:

**From File System to ASM Disk Group**: Oracle databases can be protected under ASM Disk Group even if the database being protected is actually on a file system. For more information on protecting an Oracle database from a file system under an Oracle ASM disk group, see Protecting an Oracle Database Under a File System as an ASM Disk Group on page 18.

**From ASM to File System**: Oracle databases can be protected as a file system even if the database being protected is actually on an Oracle ASM Disk Group. To protect an ASM database to a file system format, see Protecting an Oracle Database Under an ASM Disk Group as a File System on page 19.

### Supported Data Capture and Data Presentation

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Protecting an Oracle Database Under a File System as a File System

When you capture an Oracle database image under a file system, an Actifio staging disk is mapped to the Oracle server (protected node). A new file system based on file system on the OS is created on an Actifio staging disk (for example, if the source database is on Linux ext4, an ext4 file system will be created).

RMAN image copies of all data files for the entire database will be captured on an Actifio presented file system. A snapshot of the staging disk will be taken.

Protecting an Oracle Database Under an ASM Disk Group as an ASM Disk Group

When you capture an Oracle database image under an Oracle backup ASM disk group, an Actifio staging disk is mapped to the Oracle database server and presented to the Oracle ASM layer. An ASM backup disk group is created under ASM using a mapped disk.

The RMAN image copy of all data files for the entire database is captured on an Actifio-presented ASM disk group retaining the ASM header information. A snapshot of the staging disk with ASM header information is taken.

<table>
<thead>
<tr>
<th>To run backup from</th>
<th>and mount the staging disk to</th>
<th>add RAC member node</th>
</tr>
</thead>
<tbody>
<tr>
<td>protected node only</td>
<td>protected node only</td>
<td>public IP of protected node</td>
</tr>
<tr>
<td>protected node only</td>
<td>more than one node</td>
<td>public IP of protected node first and then public IP of each other node</td>
</tr>
<tr>
<td>more than one node</td>
<td>more than one node</td>
<td>public IP of protected node first and then public IP of each other node</td>
</tr>
</tbody>
</table>

To run the backup from more than one node configure tnsnames as described in Configuring Parallel RMAN Image Copy from Multiple Nodes on page 29.

The Application Advanced Settings that are required for managing databases from an Oracle ASM Disk Group are:

- **Auto Discover RAC Members**
- **RAC Member Nodes** (If auto discovery is selected then RAC Member Nodes is not required. All RAC member nodes will participate.)
- **AU_SIZE**

These are detailed in Application Advanced Settings for Oracle Databases on page 32.

For best results, pay attention to ASM Scalability and Limits (from Oracle Doc ID 370921.1) on page 17.
ASM Scalability and Limits (from Oracle Doc ID 370921.1)

Oracle Database, Enterprise Edition

For Oracle Database, Enterprise Edition, Versions 10.1.0.2 to 11.1.0.7 and 11.2.0.3, ASM imposes the following limits:

- 63 disk groups in a storage system
- 10,000 ASM disks in a storage system
- 2 terabyte maximum storage for each ASM disk (the Bug 6453944 allowed larger sizes, but that led to problems, see Note 736891.1 "ORA-15196 WITH ASM DISKS LARGER THAN 2TB")
- 40 exabyte maximum storage for each storage system
- 1 million files for each disk group
- 2.4 terabyte maximum storage for each file

Oracle Database 12c

For Oracle Database 12c, ASM imposes the following limits:

- 511 disk groups in a storage system for Oracle Database 12c Release 1 or later
- 10,000 Oracle ASM disks in a storage system
- 1 million files for each disk group

With Oracle Exadata Storage

With all Oracle Exadata Storage, Oracle ASM has the following storage limits:

- 4 PB maximum storage for each Oracle ASM disk with the AU size equal to 1 MB
- 8 PB maximum storage for each Oracle ASM disk with the AU size equal to 2 MB
- 16 PB maximum storage for each Oracle ASM disk with the AU size equal to 4 MB
- 32 PB maximum storage for each Oracle ASM disk with the AU size equal to 8 MB
- 320 EB maximum for the storage system

Without Exadata Storage, COMPATIBLE.ASM or COMPATIBLE.RDBMS disk group attribute < 12.1

Without any Oracle Exadata Storage, Oracle ASM has the following storage limits if the COMPATIBLE.ASM or COMPATIBLE.RDBMS disk group attribute is set to less than 12.1:

- 2 terabytes (TB) maximum storage for each Oracle ASM disk
- 20 petabytes (PB) maximum for the storage system

Without Exadata Storage, COMPATIBLE.ASM and COMPATIBLE.RDBMS disk group attributes > 12.1

Without any Oracle Exadata Storage, Oracle ASM has the following storage limits if the COMPATIBLE.ASM and COMPATIBLE.RDBMS disk group attributes are set to 12.1 or greater:

- 4 PB maximum storage for each Oracle ASM disk with the allocation unit (AU) size equal to 1 MB
- 8 PB maximum storage for each Oracle ASM disk with the AU size equal to 2 MB
- 16 PB maximum storage for each Oracle ASM disk with the AU size equal to 4 MB
- 32 PB maximum storage for each Oracle ASM disk with the AU size equal to 8 MB
- 320 exabytes (EB) maximum for the storage system
Protecting an Oracle Database Under a File System as an ASM Disk Group

When you capture a file system Oracle database image under an Oracle backup ASM disk group, an Actifio staging disk is mapped to the Oracle database server and presented to the Oracle ASM layer. An ASM backup disk group is created under ASM using a mapped disk.

To protect a specific file system database to ASM Disk group format, in the Application Advance Settings check the check box **Convert Filesystem Format to Oracle ASM Format**. This requires ASM to be installed and running on the protected database node.
Protecting an Oracle Database Under an ASM Disk Group as a File System

To protect an ASM database to a file system format, in the Application Advanced Settings select Yes under Convert ASM Format to Filesystem Format. File system backup will be used for all source databases including ASM.

If you are protecting an Oracle ASM database to a filesystem, then check that the Force out-of-band backup application advanced setting is enabled from the Actifio Desktop or the AGM. Application advanced settings are detailed in Application Advanced Settings for Oracle Databases on page 32.
## 5 Preparing Oracle Databases for Protection

Before Actifio appliances can manage Oracle databases, these preparation steps must be performed by a DBA.

**Preparation Procedures for Oracle Databases in Unix Environments**

<table>
<thead>
<tr>

Oracle Archive Logs Compression on page 27  
Manually Calculating Log Staging Disk Size (optional) on page 28  
Configuring Oracle Database Services for Load Balancing across Multiple Nodes on page 29 |
Preparing Oracle Databases in a Unix Environment Using OS Authentication

Before protecting an Oracle database, or if database protection jobs fail, make sure that the following settings are correct on the Oracle database server. If you plan to use Oracle Database Authentication, perform these steps first and then go to Preparing Oracle Database Authentication in a Unix Environment on page 24.

Each Oracle Database to be Protected Must be Running

Each Oracle database to be protected must be up and running. For example:

```
database: actdb
#ps -ef | grep pmon | grep -i actdb
oracle  27688     1  0  2015 ?        00:26:24 ora_pmon_actdb
```

Set the Oracle Database SID Entry

The database SID entry must be set in the /etc/oratab file (/var/opt/oracle/oratab on Solaris). For a database named “oasm” the entry looks like:

```
cat /etc/oratab
oasm:/home/oracle/app/oracle/product/11.1.0/db_1:Y
```

The Database Must Be Running in Archive Log Mode

To verify that the database is running in archive log mode, log into the database server as Oracle OS user and set the database environment variable:

```
export ORACLE_HOME=<oracle home path>
export ORACLE_SID=<database instance name> (you can get this through ps -ef | grep pmon)
export PATH=$ORACLE_HOME/bin:$PATH
```

Login to sqlplus:

```
#sqlplus / as sysdba
SQL> archive log list;
```

```
Database log mode Archive Mode
Automatic archival Enabled
Archive destination +FRA
Oldest online log sequence 569
Next log sequence to archive 570
Current log sequence 570
```

**Note:** If archive log mode is not enabled then get archive mode enabled before proceeding.

The Database Should be Using spfile

To verify that the database is running with spfile:

```
#sqlplus / as sysdba
SQL> show parameter spfile
NAME TYPE VALUE
----------------- ----------- ------------
spfile string +DATA/ctdb/spfilectdb.ora
```

**Note:** If the value is null then get the spfile set. Actifio supports backing up using pfile as well. pfile should be available in default location. For example, a Linux pfile should be located under $ORACLE_HOME/dbs.
For RAC under ASM, the Snapshot Control File Must Be Located Under Shared Disks

For an Oracle RAC database running under ASM, the snapshot control file must be located under shared disks.
To check this, connect to RMAN and run the `show all` command. Configure it if necessary:

```
RMAN target /
RMAN> show all
```

RMAN configuration parameters for database with db_unique_name CTDB are:

```
CONFIGURE RETENTION POLICY TO REDUNDANCY 1; # default
CONFIGURE BACKUP OPTIMIZATION OFF; # default
CONFIGURE DEFAULT DEVICE TYPE TO DISK; # default
CONFIGURE CONTROLFILE AUTOBACKUP OFF; # default
CONFIGURE CONTROLFILE AUTOBACKUP FORMAT FOR DEVICE TYPE DISK TO '%F'; # default
CONFIGURE DEVICE TYPE DISK PARALLELISM 1 BACKUP TYPE TO BACKUPSET; # default
CONFIGURE SNAPSHOT CONTROLFILE NAME TO '/DATA1/ctdb/snapcf_ctdb.f';
```

Configure it if necessary. For example, the above example is set to Local. To make it shared, use:

```
CONFIGURE SNAPSHOT CONTROLFILE NAME TO '+<DG name>/snap_<DB name>.f';
```

Preparing to Capture a Database from Oracle ASM to Oracle ASM

The ASM diskstring Parameter Must Be Set

If you are using Oracle ASM protection out-of-band, then check that the ASM diskstring parameter is not null. Log into the database server as ASM OS user and set the ASM environment variable:

```
# export ORACLE_HOME=<oracle ASM home path> (get this from /etc/oratab or /var/opt/oracle/oratab on Solaris systems)
#export ORACLE_SID=<ASM instance name> (you can get this through ps ?ef | grep pmon)
#export PATH=$ORACLE_HOME/bin:$PATH
```

Connect to sqlplus

```
#sqlplus / as sysasm
#sql> show parameter asm_diskstring
```

```
NAME     TYPE VALUE
------------------- ----------- ------------------------------
asm_diskstring     string ORCL:*, /dev/sdt1, /dev/sdu1
```

If the result of value is null, then get the correct ASM disk string value for existing ASM disks before proceeding with Actifio protection. The Actifio backup will add its diskstring path (`/dev/actifio/asm/*`) for its backup staging disk to map to ASM.

**Note:** For Oracle 10g, make sure the kfed utility is configured in the grid home. If it is not configured, configure kfed tool using Oracle Metalink Document ID 1346190.1.

Preparing to Capture a Database from Oracle ASM to Filesystem

The Force Out-Of-Band Advanced Setting Must Be Enabled

If you are protecting an Oracle ASM database to a filesystem, then check these Application Advanced Settings:

- **Force out-of-band backup** application advanced setting is enabled from the Actifio Desktop or the AGM.
- **Convert ASM to File System** is set to Yes. Application advanced settings are detailed in Application Advanced Settings for Oracle Databases on page 32.
Preparing Oracle Database Authentication in a Unix Environment

These additional preparation steps are required only if you will use database authentication. Oracle database authentication is described in Chapter 3, Oracle Authentication.

1. Follow the steps in Preparing Oracle Databases in a Unix Environment Using OS Authentication on page 22.

2. Create a database user account for Actifio backup (if not provided):
   
   ```sql
   sql> create user act_rman_user identified by <password>;
   ```

3. Grant sysdba access to all RAC nodes by logging into sqlplus to all nodes and running:
   
   ```sql
   sql> grant create session, resource, sysdba to act_rman_user;
   ```

   For Oracle 12c this role can be sysbackup instead of sysdba, and the database user name starts with #.

4. Verify that the sysdba role has been granted on all nodes in the RAC environment:
   
   ```
   #sqlplus / as sysasm
   # sql> select * from gv$pwfile_users;
   INST_ID USERNAME SYSDB SYSOP SYSAS
   ---------- -------------- ----- ----- ----- 
   1 SYS TRUE TRUE FALSE
   2 SYS TRUE TRUE FALSE
   1 ACT_RMAN_USER TRUE TRUE FALSE
   2 ACT_RMAN_USER TRUE TRUE FALSE
   ```

5. Test the service name as described in:

   Creating and Verifying the Oracle Servicename in a non-RAC Environment on page 24
   Creating and Verifying the Oracle Servicename in a RAC Environment on page 25

Creating and Verifying the Oracle Servicename in a non-RAC Environment

The Oracle Servicename is used for database authentication only. It is not needed for OS authentication.

Example: Database name: `dbstd`, Instance Name: `dbstd`

1. If the Oracle Servicename is not listed, then create the service name entry in the `tnsnames.ora` file at `$ORACLE_HOME/network/admin` or at `$GRID_HOME/network/admin` by adding the entry:

   ```
   act_svc_dbstd =
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = TCP)(HOST = <IP of the database server>)(PORT = 1521))
   (CONNECT_DATA =
   (SERVER = DEDICATED)
   (SERVICE_NAME = dbstd)
   )
   ```

   If the `tnsnames.ora` file is in a non-standard location, then provide the absolute path to it in the Application Advanced Settings described in Application Advanced Settings for Oracle Databases on page 32.

2. Test that the service name entry for the database is configured:

   Login as Oracle OS user and set the Oracle environment:

   ```
   TNS_ADMIN=<tnsnames.ora file location>
   tnsping act_svc_dbstd
   ```

3. Check the database user account to be sure the Actifio backup can connect:

   ```sql
   sqlplus act_rman_user/act_rman_user@act_svc_dbstd as sysdba
   ```

4. Provide the service name created (`act_svc_dbstd`) under the Oracle Service Name setting in Application Advanced Settings described in Application Advanced Settings for Oracle Databases on page 32.
Creating and Verifying the Oracle Servicename in a RAC Environment

The Oracle Servicename is used for database authentication only. It is not needed for OS authentication.

Example three-node RAC:
Database name: dbrac, Instance1 name: dbrac1, Instance2 name: dbrac2, Instance3 name: dbrac3
with database protection being set from Node3 (Instance name dbrac3):

1. Create a Servicename Entry in tnsnames.ora file at $ORACLE_HOME/network/admin or at $GRID_HOME/network/admin by adding the entry:

   ```
   act_svc_dbrac3 =
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = TCP)(HOST = <IP of the database server>)(PORT = 1521))
   (CONNECT_DATA =
   (SERVER = DEDICATED)
   (INSTANCE_NAME = dbrac3)
   (SERVICE_NAME = dbrac)
   )
   
   Where:
   HOST = This can be SCAN IP in a RAC environment or VIP or IP of the node 3 database server.
   SERVICE_NAME = database name
   INSTANCE_NAME = database instance name on node3
   ```

2. Test the service name entry created above:

   Login as Oracle OS user and set the Oracle environment:

   ```
   TNS_ADMIN=<tnsnames.ora file location>
   tnsping act_svc_dbrac3
   ```

3. Check the database user account to be sure the Actifio backup can connect:

   ```
   sqlplus act_rman_user/act_rman_user@act_svc_dbrac3 as sysdba
   ```

4. Provide the service name created (act_svc_dbrac3) under the Oracle Service Name setting in Application Advanced Settings described in Application Advanced Settings for Oracle Databases on page 32.

   If the tnsnames.ora file is in a non-standard location, then provide the absolute path to the tnsnames.ora file under the Oracle TNS_Admin Path setting in the Application Advanced Settings described in Application Advanced Settings for Oracle Databases on page 32.
Enable Database Block Change Tracking (optional)

To check if database block change tracking is enabled:

```
#sqlplus / as sysdba
#sql>select * from v$block_change_tracking;
```

<table>
<thead>
<tr>
<th>STATUS</th>
<th>FILENAME</th>
<th>BYTES</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLED</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Note: Tracking is optional. Oracle Standard Edition and Oracle Express Edition do not support tracking. Tracking is described in Oracle Database Block Change Tracking (BCT) on page 2.*

If tracking is not enabled, then enable database block change tracking from sqlplus:

**Using ASM Disk Group**

```
sql>alter database enable block change tracking using file '<ASM Disk Group Name>/
<database name>/<dbname>.bct';
```

**Using File System**

```
sql>alter database enable block change tracking using file '$ORACLE_HOME/dbs/
<dbname>.bct';
```

Protecting from an Oracle Data Guard Node

You can protect an Oracle database from primary database nodes or from Oracle Data Guard (standby) nodes. If protection is set from an Oracle Data Guard node, then make sure to set the Application Advanced Settings (see Application Advanced Settings for Oracle Databases on page 32):

**For Database Authentication**

**Username/Password:** The database user account credentials. In order for this user account to be available on the Data Guard node with sysdba access, this user must be created with sysdba privilege at the Primary node (see creating backup user account with sysdba access). Then the password file (under $ORACLE_HOME/dbs/) from the primary node must be copied over to the Data Guard node.

**For OS Authentication**

**Username/Password:** Under OS Authentication, sysdba privilege is not required. This database user account needs "connect, alter system privilege" In order for this user account to be available on the Data Guard node, this user must be created at the primary node.

Grant "connect, alter system" access:
```
sql> grant connect, alter system to act_rman_user;
```

**Oracle Data Guard Primary Node Servicename:** This is the servicename in the tnsnames.ora file configured on the Data Guard node to connect to the primary node from the standby node.
Configuring RAC Transparent Failover of Actifio RMAN Backup to Other Nodes

The Actifio Connector must be installed and running on all nodes that will be part of the backup failover configuration. The protection is set up from one node only.

In Advanced Settings, Cluster Nodes, specify the failover node choice in a Oracle RAC environment in this way:

Failover choice:Node IP:Servicename:Role

Failover Choice: the order of node in which to fail over.
Node IP: the IP address of the node where you want the backup to run
Servicename: the name of the service created and specified in the tnsnames.ora for Actifio RMAN backup. This can be a new dedicated service created for Actifio backup or the SID name (instance name) of the database on that node.
Role: F, indicating it is a failover node

To create a new servicename on failover node under tnsnames.ora file ($ORACLE_HOME/network/admin/tnsnames.ora or at $GRID_HOME/network/admin/tnsnames.ora)

Example

• 2 node RAC (dbrac1, dbrac2)
• Protection is set using database name "dbrac" from dbrac1 and failover is to be set to dbrac2
• Service name on node2: act_svc_dbrac2
• Node2 IP or scan IP: 172.1.1.0

act_svc_node2 =

(DESCRIPTION =
 (ADDRESS = (PROTOCOL = TCP)(HOST = 172.1.1.0)(PORT = 1521))
(CONNECT_DATA =
 (SERVER = DEDICATED)
 (INSTANCE_NAME = dbrac2)
 (SERVICE_NAME = dbrac)
))

In Application Advanced Settings, the Cluster Nodes entry will be:

Failover choice: Node IP: Servicename: Role
1:172.1.1.1:act_svc_node2:F

Oracle Archive Logs Compression

Actifio archivelog backup supports Oracle log backupset compression. The type of compression you select depends on the RMAN configuration settings described below. Select the right option based on your use case and available resources.

• Lower compression ratios create the least impact on backup throughput. These are best suited for environments where CPU resources are the limiting factor.
• Medium compression is recommended for most environments. These provide a good combination of compression ratios and speed.
• High compression ratios are resource intensive and are best suited for backups over slower networks where the limiting factor is network speed.

The default compression algorithm setting is BASIC. BASIC does not require the Oracle Advanced Compression option. RMAN 11G offers a wider range of compression levels with the Advanced Compression Option (ACO).
To configure the compression algorithm, use the Algorithm Name from the table above:

```
RMAN> CONFIGURE COMPRESSION ALGORITHM '<alg_name>';  
```

RMAN compresses the backupset contents before writing to disk. No extra decompression steps are required during recovery for RMAN compressed backup.

To check the type of compression set in the environment, run “SHOW ALL” from an RMAN prompt:
```
rman> show all  
```

### Manually Calculating Log Staging Disk Size (optional)

The Actifio Connector calculates the log staging disk size based on the high water mark of last 60 days of archive generation. In case of specific behavior of archive generation rate, you can specify log staging disk size under the Application Advanced Settings, detailed in Application Advanced Settings for Oracle Databases on page 32.

To calculate the archive size and archive generation rate:

1. As Oracle OS user: set the database environment (ORACLE_HOME, ORACLE_SID, PATH).
2. To check the current total log size, connect as sysdba from sqlplus:
   ```
   Sqlplus / as sysdba
   Sql> select sum(blocks*block_size)/(1024*1024*1024) from v$archived_log where deleted = 'NO';
   ```
3. Check the archive generation rate for (sixty) days:
   ```
   Sqlplus / as sysdba
   Sql>col Day format a10
   Sql>col NB_SWITCHS format 99999999999999999999
   Sql>col TOTAL_SIZE_GB format 99999999999999999999
   Sql>col AVG_SWITCHS_PER_HOUR format a22
   Sql>set pagesize 1000
   Sql>SELECT trunc(first_time) DAY,
         count(*) NB_SWITCHS,
         trunc(count(*)*log_size/(1024*1024)) TOTAL_SIZE_GB,
         to_char(count(*)/24,'9999.9') AVG_SWITCHS_PER_HOUR
      FROM v$loghist,
      (select avg(bytes) log_size from v$log)
   where first_time > sysdate - 60
   GROUP BY trunc(first_time),log_size
   order by 1;
   ```
Configuring Oracle Database Services for Load Balancing across Multiple Nodes

This procedure applies only to Oracle ASM databases protected out-of-band. In this example, assume a four-node RAC environment; nodes 3 and 4 are to be load-balanced for backup use.

Configuring Parallel RMAN Image Copy from Multiple Nodes

In a RAC environment, you can configure backup to run in parallel from multiple nodes.

1. Install the Actifio Connector on all nodes.
2. Setup the ASM disk group mapping to node 3 and node 4 using Application Advanced Settings.
3. Create a database service using srvctl to run from node 3 and node 4.
4. Use this service to specify under Application Advanced Settings. Choose Number of channels under Advance Settings (# of Channels). RMAN will distribute the channels between node 3 and node 4.
5. Also set Oracle Servicename and RAC Member Nodes.

Configuring Oracle Database Services for Load Balancing across Multiple Nodes

1. Configure in Application Advanced Settings, RAC Member Nodes: IP of node3 and IP of node 4.
2. Create a database service for the maintenance node to be used by Actifio for backup:
   
   ```
   srvctl add service -d <dbname> -s act_service_<dbname> -r <dbinstance3>,<dbinstance4>
   srvctl start service -d <dbname> -s act_service_<dbname>
   ```
3. Add the tns entry for the Oracle service name created on backup nodes (dbinstance3 and dbinstance4 node in this example) under tnsnames.ora file ($ORACLE_HOME/network/admin/tnsnames.ora or at $GRID_HOME/network/admin/tnsnames.ora)
   
   ```
   act_service_<dbname> =
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = TCP)(HOST = <SCAN IP>)(PORT = 1521))
   (CONNECT_DATA =
   (SERVER = DEDICATED)
   (SERVICE_NAME = <DATABASE NAME>)
   )
   )
   ```
4. Test the servicename created above: `tnsping act_service_<dbname>`
5. Test the service name and user credentials: `sqlplus act_rman_user/act_rman_user@act_service_<dbname>` as sysdba
6. Specify this servicename under Application Advanced Settings Oracle Servicename.
7. Create a dedicated Archivelog Backup service on a protected node (e.g. node 3) to be used for backup:
   
   ```
   srvctl add service -d <dbname> -s act_arc_service_<dbname> -r <dbinstance3>
   srvctl start service -d <dbname> -s act_arc_service_<dbname>
   ```
8. Add the tns entry for the Archivelog Backup service name created under tnsnames.ora file ($ORACLE_HOME/network/admin/tnsnames.ora or at $GRID_HOME/network/admin/tnsnames.ora)
   
   ```
   act_arc_service_<dbname> =
   (DESCRIPTION =
   (ADDRESS = (PROTOCOL = TCP)(HOST = <SCAN IP>)(PORT = 1521))
   (CONNECT_DATA =
   (SERVER = DEDICATED)
   (INSTANCE_NAME = <node 3 instance>)
   (SERVICE_NAME = act_arc_service_<dbname>)
   )
   ```
9. Test the servicename created above: `tnsping act_arch_service_<dbname>`
10. Specify this servicename under Application Advanced Settings Archivelog Backup Servicename.
6 Advanced Settings for Oracle Databases

There are two kinds of advanced settings:

- SLA Advanced Settings for Oracle Databases on page 31
- Application Advanced Settings for Oracle Databases on page 32

**SLA Advanced Settings for Oracle Databases**

SLA Policy Templates have advanced settings. SLA Advanced Settings to be addressed for Oracle databases are:

- **Truncate/Purge Log After Backup**: If you want to manage log purging, then select Truncate/Purge Log After Backup. The default is Do Not Truncate. If a policy with Enable Database Log Backup is set to No, and if Truncate Logs After Backup is Yes, then archive log purging runs at the end of each database backup, purging all the logs.

- **Enable Database Log Backup**: To enable database archive log backup select Yes. To set the frequency of log backup set the RPO (next).

- **RPO**: Set an RPO value for archive logs in minutes based on the recovery point objective for the database being protected. For example, if the recovery point objective is one hour, set RPO to 60.

- **Log Backup Retention Period**: The archive log backup under Actifio staging disk will be retained to the value set here. Backup log retention can be different from snapshot retention. For example, if snapshot retention is 2 days and dedup retention is 7 days, then a value of 7 days will ensure that all the images under dedup will have the archivelog backup to roll-forward the image to any point in time.

- **Log Staging Disk Growth Size**: Set a percentage by which to grow the staging disk when needed.

- **Estimated Change Rate**: Estimate the percentage by which the database data changes daily.

- **Compress Database Log Backup**: Select this to enable the RMAN archive backup to run in compress mode.

These SLA advanced settings can be overridden by the Application Advanced Settings for Oracle Databases on page 32:

- **Truncate/Purge Log After Backup**
- **Log Staging Disk Growth Size**
- **Estimated Change Rate**
- **Compress Database Log Backup**

RPO and Log Backup Retention Period cannot be overridden.
Application Advanced Settings for Oracle Databases

The Application Advanced Settings for an Oracle database are:

- **Username and Password**: When OS Authentication is not or cannot be employed, enter an Oracle user act_rman_user username and password for database authentication. Make sure the database user account has the proper role granted based on the **User Role in the Database** below.

- **User Role In The Database**: The default value is sysdba, but you can select sysbackup if you have an Oracle 12c database.

- **Number Of Channels**: Enter the number of RMAN channels based on the host computing power. Number of channels should be configured based on # of cores available on the server, taking into account other database backups configured to run in parallel. The default number of channels is one.

- **Staging Disk Size**: By default, the Oracle connector calculates the size as 1.5 times the maximum size of the database. To specify a value manually, allocate a staging disk to allow for two years future growth of the database. Do not confuse this entry with Log Staging Disk Size, below.

- **Staging Disk Granularity**: Default size is 1TB.

- **Last Staging Disk Minimum Size**: If an application might require multiple staging disks, enter the minimum size to be allocated for the staging disk used for the last part of that application.

- **Staging Disk Mount Point**: Allows you mount the staging disk to a specific location.

- **RMAN Log Location**: By default the rman log location is /var/act/log/rman<db name>.log. This entry allows you to change the RMAN log file location. enter the full path, with RMAN filename.

- **Restore Validate**: RMAN provides restore validation for the backups. When this box is checked, the connector will invoke RMAN restore validation for each backup. This validation will add time to the backup.

- **RMAN Catalog DB Name**: Optional: This is the CATALOG database SID name. This is for the user environment where RMAN CATALOG DATABASE is set up for RMAN backup. The CATALOG database SID name must have an entry in the tnsnames.ora file for Actifio to connect.

- **RMAN Catalog User** and **RMAN Catalog Password**: Catalog database user name and password for RMAN backup.

- **Oracle Service Name**: Provides the ability to specify a new service name in tnsnames.ora file to be used by Actifio backup, as described in Creating and Verifying the Oracle Servicename in a non-RAC Environment on page 24 and in Creating and Verifying the Oracle Servicename in a RAC Environment on page 25. If not specified, then by default Actifio will use the Oracle SID name (instance name) as the service name. Either the new service name or the default SID name must have an entry in the tnsnames.ora file for Actifio to connect. The Oracle Servicename is used only with database authentication.

- **Oracle Data Guard Primary Node Service Name**: This is the service name in the tnsnames.ora file configured on the Data Guard node to connect to the primary node from the standby node. This is required only when you are protecting data from Oracle Data Guard. For more information, see Protecting from an Oracle Data Guard Node on page 26.

- **Cluster Nodes**: Specify a failover node choice in format $failover choice:Node IP:servicename:role$. This is used for RAC only, see Configuring RAC Transparent Failover of Actifio RMAN Backup to Other Nodes on page 27. Example: 1:172.16.16.21:svc_orarac2_act:F role should be F (failover). role can also be M (maintenance). When an appliance member role is M, then the Actifio appliance uses this as the backup node instead of using the original protected node.

- **Connector Options**: Use this only under the direction of Actifio Support.

- **Log Purging Retention Period**: In the space provided, enter the number of hours to retain archive logs in the primary log destination. For example, if this is set to 4, then archive logs older than four hours will be purged from the database primary archive destination. The default value is 24 hours.
Note: If you set Log Purging Retention Period to 0, then the log will be purged immediately after the backup job is finished. If you do this, set Successful Log Backups Before Purge to at least 1.

• **Successful Log Backups Before Purge**: By default, archive purging does not check for the number of successful log backups. Enter a number of successful log backups after which to run the archive purge.

• **Maxcorrupt Parameter Setting**: RMAN backup will continue with backup skipping the said number of corrupted data block in each datafile. By default this value is 0 and backup will fail if there is any corrupt data block in any data file.

• **AU_SIZE**: AU_SIZE: Parameter to configure ASM Diskgroup AU size, in MB, default is 4MB. This only takes effect during diskgroup creation, which is during level 0 job. Set this before the first snapshot, or select Force new level 0 to recreate the disk group (be sure to have enough free space when using this option).

• **Log Staging Disk Size**: This applies when a log backup policy is set. By default Actifio will use the 30-day high-water mark to determine the staging disk size for archive backup staging disk. To specify a value manually, refer to Manually Calculating Log Staging Disk Size (optional) on page 28 for more information on determining this value.

• **Do Not Uncatalog**: To keep RMAN backup cataloged after each backup job. By default, Actifio backup will be cataloged at the start of backup and then be un-cataloged at the end of the backup.

• **Force New Level 0 Backup**: If for any reason a full level 0 backup is required, overwriting the Actifio incremental backup, then check this box for a single backup job. Be sure to uncheck it after the full level 0 backup is complete, or else this will force each backup to be a new level 0 Oracle RMAN out-of-band backup. This has impact on snapshot pool storage.

• **Crosscheck Archivelog**: Select this to run crosscheck and delete expired archivelogs on archive backup.

• **Crosscheck Backup of Archivelog**: Select this to run crosscheck on the current backed up archivelog before the new logs are backed up, and delete expired archivelogs.

• **Oracle Configuration File Location**: Use this if you are backing up any Oracle configuration files with an Oracle OOB backup such as wallet for encryption support. This requires a full path name. If the folder name is specified then all files under that folder will be backed up. If a file name is specified then only the specified file will be backed up.

Note: For security reasons, keys are not backed up with the database backup.

• **Oracle TNS_Admin Path**: If tnsnames.ora is in a nonstandard location, then provide the full path of the directory where it is located. The Oracle TNS_Admin Path is used only with database authentication.

• **Archivelog Backup Servicename**: Provide a dedicated Oracle database service name for the archive log backup in RAC environment when Oracle service name is set to run from more than one node. The Archivelog Backup Servicename is used only with database authentication.

• **Convert ASM Format to Filesystem Format**: By default, the database is captured in its native format, either ASM or file system. The backup destination is ASM to ASM and non-ASM to file system. Set this to Yes if the source database is ASM and backup destination must be set to file system.

• **Convert Filesystem Format to Oracle ASM Format**: By default, the database is captured in its native format, either ASM or file system. The backup destination is ASM to ASM and non-ASM to file system. Set this to Yes if the source database is under file system and backup destination must be set to Oracle ASM. This requires ASM to be installed on the Oracle server.

• **Auto Discover RAC Members**: Check this to autodiscover all members of the RAC databases in an ASM disk group out-of-band configuration. This enables mapping the staging disk to all nodes. Auto-discovery will not work if the hostname does not have a FQDN. In that case add the nodes manually.
• **RAC Member Nodes**: If you choose not to autodiscover RAC members, then provide a node list for mapping the staging disk as a shared volume for backup. List the protected nodes first. Use this only for protecting Oracle databases in an ASM disk group.

• **Truncate/Purge Log After Backup**: This is to set the archive log purging. The current database archive logs will be purged with the next database backup job. If database logs are protected, then purging is based on the Log Purging Retention Period option. See [Archive Log Purge Behavior Policy Advanced Settings are Overridden by Application Advanced Settings](#) on page 34.

• Choose **Do Not Unmap** if you want temporary staging disks mapped to the host and used during data movement for backup to remain mapped to the host. LUNs are mapped during the first job and all the subsequent jobs reuse the same mapped LUN. By default, this option is selected.

• **Compress Database Log Backup**: Flag to enable the log backup compression. If selected, the backup of archive log will be run using RMAN compress option.

• **Estimated Change Rate**: Entering a percentage for the database’s daily change rate will allow the Actifio appliance to better predict how to grow the staging VDisk for the database’s log file.

• **Force Out-Of-Band Backup**: This option is to force an out-of-band backup when database datafiles are in-band. This is used only for databases stored in-band on storage managed by an Actifio appliance.

Virtualizing an Oracle database allows you to maintain up-to-date copies of it and to mount them for different business resiliency and agility purposes such as data protection and test/dev work. Before you can virtualize and protect Oracle databases, see:

- Chapter 2, Actifio Prerequisites for Protecting an Oracle Database
- Chapter 3, Oracle Authentication
- Chapter 4, Data Capture under File System and under ASM Disk Group
- Chapter 5, Preparing Oracle Databases for Protection.

You can protect Oracle databases through both AGM and the Actifio Desktop:

- Virtualizing an Oracle Database for Data Protection and Agility via the Actifio Desktop on page 37
- Virtualizing an Oracle Database for Data Protection and Agility using the AGM on page 39

### Virtualizing an Oracle Database for Data Protection and Agility via the Actifio Desktop

To protect an Oracle database:

1. Open the Application Manager to the Protect tab.
2. From the navigation pane, select the Oracle database to protect.
3. Select an SLA template from Template drop-down list. This is the template that defines the snapshot/deduplication/replication of the application data. Policies with database log backup enabled allow you to protect both your database and its log file snapshots with a single policy.
4. Select a resource profile from Profile drop-down list. This defines the resources used to store the data.
5. Click the Advanced Settings link to set the application Advanced Settings. Advanced settings are detailed in Chapter 6, Advanced Settings for Oracle Databases. When you are finished with the Advanced Settings, click Save and the Advanced Setting dialog closes.
6. If you will be using database authentication, then in the Application Advanced Settings Credentials, provide the RMAN backup credentials, and click Test to test the connection.

**Note:** You must have the login credentials for sysdba or sysbackup (in Oracle 12c) privileges. You must enter the RMAN backup user account and password and then click Protect to proceed.
Applying Protection to an Oracle Database

7. Click **Protect**. A Warning screen appears if the SLA template policy will result in a potential impact to system resources.

8. Either wait for the scheduler to start the job or run a backup from **Backup Now**. The time depends on the size of the database and the number of RMAN channels available (see Chapter 6, Advanced Settings for Oracle Databases). You can monitor progress from the System Monitor. For details, see the UDSAgent log at /var/act/log/UDSAgent.log and the RMAN log file at /var/act/log/<sid>_rman.log.

**Note:** If the template will capture logs, and if you have software that purges logs through RMAN, be sure to disable it. If that purge runs during an Actifio backup job, the backup may have incomplete log information.
Virtualizing an Oracle Database for Data Protection and Agility using the AGM

To capture an Oracle database and its logs:

1. Open the AGM to the **Application Manager** and enter the database application name or use the filters to make it easier to get to the database that you need.

2. Right-click the application and select **Manage SLA**.

3. On the Manage SLA page, select a template and a profile and click **Apply SLA**.
4. The Apply SLA dialog opens. Assign policy overrides and change application settings as needed.

Applying SLA Policy Overrides in the AGM

5. You can wait for the job to run during the period scheduled in the SLA, or you can run the job at the next opportunity by clicking on the desired job and selecting Run SLA.

Running the SLA in the AGM (Optional: If You Do Not Want to Wait for the Scheduled Time)

6. The job runs as soon as the scheduler has an opening, often immediately. You can go to the System Monitor to view the progress and details of the job.
Note: If the template will capture logs, and if you have software that purges logs through RMAN, be sure to disable it. If that purge runs during an Actifio backup job, the backup may have incomplete log information.
Actifio offers several ways to access data, including mounting and restoring. The procedures to use with the Actifio Desktop are described in Accessing Data on page 4 and detailed here. These procedures are a little different in the Actifio Global Manager. If you are using the AGM, refer to the AGM online help.

The most common ways to access an Oracle database:

The **standard mount** provides instant access to data without moving data. Captured copies of databases can be rolled forward via the Actifio user interface and mounted on any database server. Standard mount methods include:

- Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44
- Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46

The **Application Aware mount** presents and makes the captured Oracle database available to a target server as a virtual Oracle database. This allows you to address the unique challenges associated with creating and managing copies of production databases for non-production use. Application Aware mounts are performed from the Actifio appliance and do not require manual intervention by database, server, or storage administrators. Application Aware mounts can be used for such things as database reporting, analytics, integrity testing, and test and development. Application Aware mounts are described in Mounting an Oracle Database as a Virtual Application on page 48.

The **restore** function reverts the production data to a specified point in time. Restore operations actually move data. Typically restore operations are performed to restore a database to a valid state after a massive data corruption or storage array failure. The amount of time required to complete a restore operation depends on the amount of data involved. To restore a database, see Restoring a Database via the Actifio Desktop, Overwriting the Production Database on page 63.

You can also clone and LiveClone Oracle databases following the general procedures in Accessing and Recovering Copy Data with the Application Manager; there are no Oracle-specific procedures for those methods of data access.

Oracle-specific workflows are detailed in Creating Automated Workflows for Oracle Databases.

After any database server reboot where an Actifio image is mounted, or if Actifio backups are in progress for the database at the time of reboot/crash, please see Bringing Actifio-Protected ASM Diskgroups Back Online after Reboot of a Target DB Server on page 51.
Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access

To mount an Oracle database image for data access:

1. Open the Actifio Desktop to the Application Manager and select the Restore tab.
2. In the Navigation pane, select the protected Oracle application.

3. Under Select a backup on the right, select a snapshot image.
4. From the gear icon dropdown menu, select Mount. The Mount window opens.
Mount Details for an Oracle Database with ASM Data

5. Provide a label as needed. This is optional.
6. If necessary, change the default storage pool from the Select default storage pool drop-down list. The available free space in the pool is indicated in parentheses.
7. In the Select Host drop down list, select target Node1 of the RAC node.
8. Enter a diskgroup name for the mounted image copy under Preferred diskgroup name.
9. RAC Node list:
   o To provision a RAC database on the target RAC cluster, specify the IP address of all nodes for the target RAC cluster separated by a colon (:) in the order of RAC nodes 1,...,n. The first IP address in RAC Node list must be the selected host’s IP address.
   o To provision a single node RAC database on a target RAC cluster or a standalone database under ASM on a non-RAC ASM target, provide the IP address of the target node.
10. Mount Drive: Ignore this setting.
11. Mount Point: Enter the full path at which you want to mount the log.
   o If the path exists as an empty folder, the Actifio Connector will use it.
   o If it does not exist, the Connector will create it.
   o If it exists as a file or as a folder that is not empty, then the job will fail.

If there are multiple volumes to be mounted, the Connector uses the mount point that you specify for one of the volumes, and for the remaining volumes it appends an underscore followed by a number, i.e., `<specified>_##`
   o The Oracle database image will be mounted to ASM with a disk group name specified under `<preferred disk group>` (see Step 8).
   o If logs are Actifio-protected, then the logs image will be mounted to `/act/mnt/<jobid>_Log`, and subsequent logs images to `/act/mnt/<jobid>_Log_1`, `/act/mnt/<jobid>_Log_2`, and so on.

12. Check Select All to mount all volumes.
Mounting an Oracle Database Image Protected Under a File System for Data Access

To mount an Oracle database image from a file system for data access:

1. Open the Actifio Desktop to the **Application Manager** and select the **Restore** tab.
2. In the Navigation pane, select the protected Oracle application.

3. Under **Select a backup** on the right, select a snapshot image.
4. From the gear icon dropdown menu, select **Mount**. The Mount window opens.

---

**Mounting an Oracle Database**

**Mount Details for an Oracle Database from a File System**
5. Provide a label as needed. This is optional.
6. If necessary, change the default storage pool from the Select default storage pool drop-down list. The available free space in the pool is indicated in parentheses.
7. Select Host drop down list: Select the primary node.
8. Mount Drive: Ignore this setting.
9. Mount Point: Enter the full path at which you want to mount the volume.
   - If the path exists as an empty folder, the Actifio Connector will use it.
   - If it does not exist, the Connector will create it.
   - If it exists as a file or as a folder that is not empty, then the job will fail.
   If there are multiple volumes to be mounted, then the Connector uses:

<table>
<thead>
<tr>
<th>Volume(s)</th>
<th>Mount Point</th>
<th>No Mount Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Image</td>
<td>/&lt;mountpoint&gt;</td>
<td>/act/mnt/&lt;jobid&gt;</td>
</tr>
<tr>
<td>Logs Image</td>
<td>/&lt;mountpoint&gt;_Log</td>
<td>/act/mnt/&lt;jobid&gt;_Log</td>
</tr>
<tr>
<td></td>
<td>and subsequent logs images to /act/mnt/&lt;jobid&gt;_Log_1, /act/mnt/&lt;jobid&gt;_Log_2, and so on</td>
<td></td>
</tr>
</tbody>
</table>

10. Check **Select All** to mount all volumes.
Mounting an Oracle Database as a Virtual Application

Before You Begin

An Actifio Application Aware mount mounts a captured Oracle database as a virtual application. It allows you to quickly bring a database online without having to actually move the data and without having to manually configure a new instance of the database. An Application Aware mount addresses the challenges of creating and managing copies of production databases without manual intervention by database, server, and storage administrators.

Note: Oracle virtual applications consume a minimum 300 MB to account for redo logs and the control file.

Note: An SSH connection between RAC nodes is required for application aware mount to RAC nodes.

Note: The ASM diskstring parameter must be set on any target server. See The ASM diskstring Parameter Must Be Set on page 23.

Patching Oracle 12c

Actifio Application Aware mounts may fail if your Oracle 12c installation does not include this patch, which can be downloaded from the Oracle support portal:
Oracle Database 12c Bug# 19404068 (ORA-1610 ON RECOVER DATABASE FOR CREATED CONTROLFILE)

- (Patch 19404068) Linux x86-64 for Oracle 12.1.0.2.0
- (Patch 19404068) IBM AIX on POWER Systems (64-bit) for Oracle 12.1.0.2.0
- (Patch 19404068) Solaris on SPARC (64-bit) for Oracle 12.1.0.2.0

To see if the patch is installed, run:

```
$ cd $ORACLE_HOME/OPatch
$ ./opatch lsinventory -details
$ ./opatch lsinventory -details | grep 19404068
```

Pre-checks to Mount an Oracle Database as a Virtual Application

- Make sure that the database versions are matching between source host and target host:
  - Source: Where the source database is running
  - Target: Where you are trying to perform an Application Aware Mount

- Make sure that there are enough resources (like memory & CPU) on the target database server based on your performance requirements.

Mounting an Oracle Database as a Virtual Application

To mount an Oracle database as a virtual application:

1. Start mounting the image as detailed in Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46. At the bottom of the Mount page, select App Aware Mount.
Mounting and Confirming an Application Aware Oracle Database Mount

2. Fill in the form as needed for this virtual application. Fields marked with an asterisk (*) are required. The ? icons beside each field provide helpful information.

   o **Target Database SID**: Specify the SID for the new Oracle database to be provisioned on the target. Follow standard Oracle naming conventions for this value. Make sure that the target host database version matches the version of the source host, and that there are enough resources on the target database server. Follow standard Oracle naming conventions for this value.

   o **User Name/Password**: Specify Oracle Operating System user credentials on the target. A password is optional except in the case of Oracle 12c on Windows only, in which case it is required.

   o **Oracle Home Directory**: Specify the Oracle Home Directory ($ORACLE_HOME) on the target database server.

   o **TNS Admin Directory path**: Specify TNS_ADMIN Directory path (path of tnsnames.ora file) on the target database server.

   o **Database Memory Size in MB**: Database total memory size, in MB, for the database being provisioned on the target. See the table below for the expected behavior depending on how this and SGA% (next) are set.

   o **SGA%**: Parameter to configure SGA/PGA memory, as a percentage of total memory, for the database being provisioned. See the table below for the expected behavior depending on how this and Database Memory Size in MB (above) are set.
### Database Memory Size in MB

<table>
<thead>
<tr>
<th>SGA%</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>not specified</td>
<td>Total database memory size and memory parameter on target will be the same as source database.</td>
</tr>
<tr>
<td>specified</td>
<td>MEMORY_TARGET parameter will be set for the database being provisioned on the target.</td>
</tr>
<tr>
<td>specified</td>
<td>Set SGA and PGA for the database provisioned on the target to:</td>
</tr>
<tr>
<td></td>
<td>SGA_TARGET = Database Memory Size in MB x (SGA%/100)</td>
</tr>
<tr>
<td></td>
<td>PGA_TARGET = Database Memory Size in MB x (100-SGA%/100)</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not set SGA to 100. To avoid database slowness, be sure to reserve some memory space for PGA.</td>
</tr>
</tbody>
</table>

- **REDO Size**: Parameter to configure REDO size, in MB, for the database being provisioned. If not specified, REDO size is be set to 1000 MB.
- **shared_pool_size in MB**: Parameter to configure shared pool size, in MB, for the database being provisioned. If not specified, shared_pool_size will not be used.
- **db_cache_size in MB**: Parameter to configure database cache size, in MB, for the database being provisioned. If not specified, db_cache_size will not be used.
- **db_recovery_file_dest_size in MB**: Parameter to configure database recovery file destination size, in MB, for the database being provisioned. If not specified, db_recovery_file_dest_size will be set to 50000 MB.
- **diagnostic_dest**: Parameter to configure diagnostic destination on the host. If not specified, diagnostic_dest will be set to ORACLE_HOME.
- **Max number of processes**: Parameter to configure max number of system user processes that can simultaneously connect to Oracle, for the database being provisioned. If not specified, processes will be set to 500.
- **Max number of open cursors**: Parameter to configure maximum number of open cursors that a session can have at once, for the database being provisioned. If not specified, number of open cursors will be using source database settings.
- **Character set**: Parameter to configure character set encoding, for the database being provisioned. If not specified, AL32UTF8 will be used.
- **TNS Listener IP**: Specify IP address for the TNS Listener. It can be one of SCAN IP, VIP, or Host IP. If not specified, Host IP will be used.
- **TNS Listener port**: TNS Listener port to be used to create service name under tnsnames.ora for provisioned database on target. If not specified, port 1521 is used.
- **TNS Domain Name**: Specify domain name to be used with service name under tnsnames.ora for provisioned database on target. This is needed when database service is using Domain Name.
- **Do not change database DBID**: If selected, new database’s DBID will not be changed.
- **Do not update tnsnames.ora**: If selected, an entry for the new database will not be added to tnsnames.ora. This may require manual intervention for connections to the new database, and in some cases snapshot jobs for the new database will fail without this manual intervention.
o **Restore with Recovery**: If selected, brings the newly created database online: the provisioned database on target will be open for read and write. This is the default selection.

o **Stand Alone Non-RAC**: This is only applicable for databases where the source database is in a RAC configuration and Actifio stores the copy in ASM format. If selected, this performs an application aware mount to a stand alone ASM non-RAC instance. Do not select this option if a RAC node list has been provided.

o **Environment variable**: If you have any user-defined environment variables to be passed to pre/post scripts, you can enter one here.

3. The application aware mount will be a new database. If you want to protect the new database, then check **Protect New Applications?** to apply an SLA to the new database. New Template and Profile fields will appear where you can select any of your existing SLA templates and resource profiles.

   The application aware mount will be a new database. You can have the new database protected by applying an SLA when you create the new database. The snapshots of the database are incremental unless you apply a policy template with Force Out-of-Band Backup checked.

   **Note**: There is one exception to this: if the target server is a VMware VM, you must select "pRDM" when performing the mount if you want the child database to have the efficient incremental snapshots. If you forget and leave the default of "vRDM", then the first snapshot job will be a full backup.

4. Click **Next** to view a confirmation window. If everything is satisfactory, click **Done**.

---

**Bringing Actifio-Protected ASM Diskgroups Back Online after Reboot of a Target DB Server**

After any database server reboot where an Actifio copy is mounted, or Actifio backups are in progress for the database at the time of reboot/crash, to get the Actifio disk group mount back:

1. Check that the target database server is back up and that ASM and RAC system are also up.
2. Restart the Actifio Connector (from root).
3. Set ASM environment.
4. Login to ASM sqlplus and check the disk group status:
   ```sql
   select name, state from v$asm_diskgroup where name = '<dg name>';
   ```
5. If unmounted, mount the disk group:
   ```sql
   alter diskgroup <dg name> mount;
   ```
6. Login to the Oracle OS and set the database environment, then start the database.
Using Actifio Workflows to Refresh Oracle Database Schemas

If you are using Oracle 12c, then refer to Presenting an Oracle 12c Database PDB as a Virtual PDB to an Existing Database Container on a Target on page 57.

Suppose you have a source database instance with multiple applications, and each application has its own schema. You can:

- Create and refresh a virtual copy at the schema level, and refresh each schema individually to the same target or to a different target.
- Create and refresh multiple virtual copies of a single schema to a single target under different schemas, each with its own refresh schedule.

This section includes:

- Before You Begin on page 53
- Creating the Workflow on page 53
- Running the Workflow on page 55
- Unmounting Mounted Images on page 56

How it works: Actifio virtual copy with transportable tablespace

Create and refresh multiple virtual copies under a single target Oracle instance from the same or from multiple source instances.

1. Set up an application-aware mount workflow to create an application-aware mount with a temporary instance.
2. Set up a pre-script to run on the target instance (offline and drop the tablespace to be refreshed on the target instance).
3. Set up a post-script to be run on the temporary instance and the target instance.
4. On the temporary instance:
   a. Rename the tablespace
   b. Change the tablespace to read-only
   c. EXPDP: Export the tablespace metadata.
   d. Shut down the temporary instance.
5. On the target instance:
   a. IMPDP: Import the tablespace metadata (TRANSPORT_DATAFILES with remap schema to target instance
   b. Change the tablespace to read-write
Before You Begin

Before you begin:

1. If the source environment has not been discovered, see *Connecting Hosts to Actifio Appliances* to add the host.
2. Discover the database as described in the AGM online help or in *Virtualizing and Protecting Copy Data with the Application Manager*.
3. Once the database is discovered, protect it as described in Chapter 7, *Virtualizing an Oracle Database for Data Protection and Agility*.
4. Ensure database backups are running as per the SLA policy.
5. Set up the scripts on the target server:
   a. Login to database server as root and cd to /act (cd /act)
   b. Create /act/scripts directory if not there:
      
```bash
mkdir scripts
cd /act/scripts
```
   c. Copy the files from /act/act_scripts/objectrefresh/
   d. Move `act_<schema>_refresh.conf` to `act_testuser_refresh.conf` for a target schema name of testuser where `<schema>` is testuser.

Below is the sample configuration file.

```
[oracle@asmnode3 scripts]$ cat act_testuser_refresh.conf
SOURCE_SCHEMA_NAME=TEST_USER
TARGET_SID=scripts
TARGET_SCHEMA_NAME=TEST_USER3
```

where:

- **SOURCE_SCHEMA NAME** -> Source database schema to be presented to target.
- **TARGET_SID** -> Target database SID, where schema will be refreshed.
- **TARGET_SCHEMA_NAME** -> Target database schema to be refreshed with Source Schema.

---

**Note:** TARGET and SOURCE Schema names can be the same or different.

---

Creating the Workflow

Create a workflow to perform the schema refresh.

1. Open the Actifio Desktop to the Application Manager. In the Navigation Pane under App, select the Source database and click on Workflow.
2. Enter the name of the Workflow and click on Direct Mount.
3. Select On Demand radio button.
4. Select the target server by clicking on + symbol.
5. Provide mount point name if the temporary copy is going to be on NON-ASM.
6. Fill up the pre-script field as below.
   ```
   act_ttswf_pre.sh act_<SCHEMA>_refresh.conf
   ```
   Where act_<SCHEMA>_refresh.conf is the file created from Step 5.
7. Fill up the post script field as below
   ```
   ttswf_post.sh act_<SCHEMA>_refresh.conf
   ```
   Where act_<SCHEMA>_refresh.conf is the file created from Step 5.
8. Enter a timeout value of 1800 or more seconds:
9. Select Perform Application Aware Mount
10. Fill the target database SID (This is temporary SID.)
11. Provide the OS Username who owns the Oracle software binary on the target machine.
12. Provide ORACLE_HOME as specified in the configuration file.
14. Specify the minimum SGA for the temporary instance.
15. Select **Standalone Non-RAC**.
16. Click **Done**

### Running the Workflow

Once the workflow is created:

1. Click the **Run Now** button.
2. Select the required image from Source Image list and click **Done**.
   
   Logs can be monitored on the target host at location: `/var/act/log`

3. Once the workflow turns to success state, the schema on the target database is refreshed.
   
   a. If the `TARGET_SCHEMA_NAME` does not exist on the target database, Actifio will create a user for the first time and default user password is abc#1234.
   
   b. Tablespaces for the refreshed schema on target database get presented to the target with prefix of schema name. `<Schema>_<Source_Tablespace_Name>`
4. If the target schema need to be refreshed again with latest or old Source data, click the Workflow Run Now button, select Refresh Existing Virtual Application, and click Done.

Unmounting Mounted Images
To unmount any mounted images:

1. From the Restore tab, select the image to unmount.
2. Drop the tablespace and datafiles on the target database.
   SQL>alter tablespace <TBS_NAME> offline immediate;
   SQL>drop tablespace <TBS_NAME> including contents and datafiles;
3. On Actifio Desktop > Application Manager > Restore Tab, select the image to be unmounted. Click the gear wheel and select Unmount and Delete as shown below and then Submit the job.
Presenting an Oracle 12c Database PDB as a Virtual PDB to an Existing Database Container on a Target

If you are using an Oracle version earlier than 12c, then refer to Using Actifio Workflows to Refresh Oracle Database Schemas on page 52.

Suppose you have a source database instance with multiple applications, and each application has its own PDB. You can:

- Create and refresh a virtual copy at the schema level, and refresh each PDB individually to the same target or to a different target.
- Create and refresh multiple virtual copies of a single schema to a single target under different PDB, each with its own refresh schedule.

To virtualize an Oracle 12c Pluggable Database (PDB):

Before You Begin on page 53
Creating the Workflow on page 58
Running the Workflow on page 60
Unmounting Mounted Images on page 61

Before You Begin

Before you begin:

1. Set up the scripts on target server:
   - Get the script zip file from Actifio.
   - Login to database server as root:
   - cd to /act (cd /act)
   - Create an /act/scripts directory if not there:
     
   - Unzip the file.
   - Copy the script files into /act/scripts

2. Edit and modify act_pdb_config.conf script for input parameters.
   vi act_pdb_config.conf

Replace the lines:

TARGET_SID="<Database SID where PDB refresh required>"
TARGET_TMP_SID="<Temporary Database SID Name>"
PDB_NAME="<List of source PDB names separated by ', '>"
OS_USER="<OS User who owns Oracle Binary>"
ORACLE_HOME="<Oracle Home Location on Target Server>"

With:

TARGET_SID=prddb1
TARGET_TMP_SID=tmpdb
PDB_NAME=pdb1_new,pdb2_new
OS_USER=oracle
ORACLE_HOME=/home/oracle/12.0.1/dbhome_1
Creating the Workflow

1. Create a workflow to perform the PDB clone. From the Actifio Desktop Application Manager, under App select the source database and click the *Workflow* tab.

2. Enter the name of the Workflow and click **Direct Mount**.

3. Select the **On Demand** radio button.

4. Select the target server by clicking on the + symbol.

5. Provide a mount point name if the temporary copy is going to be on NON-ASM.

6. Fill in the pre-script field:
   
   ```
   act_pdbclone_pre.sh act_pdb_config.conf
   ```
   
   Where act_pdb_config.conf is the file created from Step 2.

7. Fill in the post script field:
   
   ```
   act_pdbclone_post.sh act_pdb_config.conf
   ```
   
   Where act_pdb_config.conf is the file created from Step 2.

8. Set **Timeout** to 3200 or more.
9. Select **Perform application aware mount**.
10. Fill in the target database SID (This is temporary SID as defined in the act_pdb_config.conf file.)
11. Provide the OS username who owns the Oracle software binary on the target machine.
12. Provide ORACLE_HOME as specified in the configuration file.
14. Specify the minimum SGA for the temporary instance.
15. Select **Standalone Non-RAC**.
16. Click **Done**.
Running the Workflow

1. Once the workflow is created, click Run Now button.
2. Select the required image from Source Image list and click on Done.
3. Logs can be monitored on the target host at: /var/act/log
4. Once the workflow turns to success state, PDB on the target database will be cloned.
5. If the target PDB must be refreshed again with latest or old source data, click on the Workflow Run Now button and select **Refresh Existing Virtual Application** option and click **Done**.

**Unmounting Mounted Images**

To unmount any mounted images:

1. From the Restore tab, select the image to unmount.
2. Drop the pluggable database and datafiles on the target database.

   ```sql
   SQL> alter pluggable database <PDB_NAME> close immediate;
   SQL> drop pluggable database <PDB_NAME> including datafiles;
   Or:
   cd /act/scripts
   ```
Execute the Pre script:

```
./act_pdbclone_pre.sh
```

3. From the Actifio Desktop Application Manager Restore tab, select the image to be unmounted. Click on the gear icon and select **Unmount and Delete** and then **Submit** the job.
Restoring a Database via the Actifio Desktop, Overwriting the Production Database

To restore an Oracle database out-of-band backup image, overwriting the original production database:

1. Open the Actifio Desktop to the **Application Manager**.
2. In the navigation pane, expand the Oracle list and select the Oracle database to be restored.
3. Under SLA Options, set **Run Schedule** to **No**. This is to prevent a new protection job from starting.

4. Click the **Restore** tab. The restore screen for the selected database is displayed.
5. From the calendar tool, select the date/time range in which the database image was taken. If the policy that protected the database had log protection enabled, the backup represents both the database and its logs.
6. Click the **Snapshot** button.
7. Select the backup image to restore from the **Select a backup** on the right. When selected, an icon turns green and detailed information about it is displayed.
8. From the backup instance pull-down menu, select **Restore** and the Restore Job window is displayed.

9. Check the **Restore with recovery** option to bring the restored database online in a Read_Write state. If this is unchecked, the database will be left in the Mounted state.

10. If log protection is not enabled for this image, then you do not see the roll-forward window; skip to Step 11.
   If you have logs and want to use them to roll forward to a specific point in time, then:
   - Select whether to base the dates and times on User time or Host time. User time is relative to the viewer of the current screen. Host time is relative to the system that hosts the data to be restored.
   - From the calendar tool select a date from which to initiate the restore operation.
   - Slide the slider tool to select the point in time to restore to.

11. Enter the Oracle OS user name password credentials.

12. Check **Select All** to restore all volumes.

13. Click **Submit**. A warning dialog appears. Read it and enter **DATA LOSS** to confirm.

14. Another warning appears. Type **OVERWRITE OTHER APPS** to confirm, and click **Start Restore**.

15. If you restored a RAC cluster, then when the restore job is finished, start the database on all RAC nodes.

---

**Note:** When you restore a database, the SLA options (Run Schedule, Expire Data) of the database are disabled.
Accessing, Recovering, or Restoring an Oracle Database via the AGM

Actifio offers several ways to access data, including mounting and restoring. This chapter details the procedures to use with the AGM. The procedures to use with the Actifio Desktop are described in Accessing Data on page 4 and detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.

The most common ways to access an Oracle database:

The **standard mount** provides instant access to data without moving data. Captured copies of databases can be rolled forward via the Actifio user interface and mounted on any database server. Standard mount methods include:

- Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access from the AGM on page 66
- Mounting an Oracle Database Image Protected Under a File System for Data Access from the AGM on page 69

The **Application Aware mount** presents and makes the captured Oracle database available to a target server as a virtual Oracle database. This allows you to address the unique challenges associated with creating and managing copies of production databases for non-production use. Application Aware mounts are performed from the Actifio appliance and do not require manual intervention by database, server, or storage administrators. Application Aware mounts can be used for such things as database reporting, analytics, integrity testing, and test and development. Application Aware mounts are described in Mounting an Oracle Database as a Virtual Application in the AGM on page 72.

The **restore** function reverts the production data to a specified point in time. Restore operations actually move data. Typically restore operations are performed to restore a database to a valid state after a massive data corruption or storage array failure. The amount of time required to complete a restore operation depends on the amount of data involved. To restore a database, see Restoring a Database via the Actifio Desktop, Overwriting the Production Database on page 77.

You can also clone and LiveClone Oracle databases following the general procedures in the AGM online help; there are no Oracle-specific procedures for those methods of data access.

Oracle-specific workflows in the AGM are detailed in the AGM online help.

After any database server reboot where an Actifio image is mounted, or if Actifio backups are in progress for the database at the time of reboot/crash, please see Bringing Actifio-Protected ASM Diskgroups Back Online after Reboot of a Target DB Server on page 76.
Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access from the AGM

To mount an Oracle database image for data access:

1. Open the AGM to the Application Manager and enter the database application name or use the filters to make it easier to get to the database image that you need.

2. Right-click the application and select Access.

3. On the Access page, select the desired image and click Mount under the Mount menu.
4. On the Mount page, fill in the required information.

**Mount Details for an Oracle Database in the AGM**

- **Under Target**, select a host to mount the new database on, and provide a Label as needed. This is optional.
- **Under Application Options**, deselect **Create New Virtual Application**.
  - If you want to create an application aware mount, then see *Mounting an Oracle Database as a Virtual Application in the AGM* on page 72.
- Open the **Mapping Options** by clicking on the arrow icon to the left of the title.
- If necessary, change the default storage pool from the **Storage Pool** drop-down list. The available free space in the pool is indicated in parentheses.
- **Mount Location**: Enter the drive letter or the full path at which you want to mount the new database:
  - If the path exists as an empty folder, the Actifio Connector will use it.
  - If it does not exist, the Connector will create it.
  - If it exists as a file or as a folder that is not empty, then the job will fail.
  - If there are multiple volumes to be mounted, the Connector uses the mount point that you specify for one of the volumes, and for the remaining volumes it appends an underscore followed by a number, i.e., `<specified>_#`.
- Enter a diskgroup name for the mounted image copy at **Disk Group Name**.
- **Enter the RAC Node List**:
  - To provision a RAC database on the target RAC cluster, specify the IP address of all nodes for the target RAC cluster separated by a colon (:) in the order of RAC nodes 1...n. The first IP address in RAC Node list must be the selected host’s IP address.
  - To provision a single node RAC database on a target RAC cluster or a standalone database under ASM on a non-RAC ASM target, provide the IP address of the target node.
- The Oracle database image will be mounted to ASM with a disk group name specified under **Disk Group Name**.
o If logs are Actifio-protected, then the **logs image** will be mounted to /act/mnt/<jobid>._Log, and subsequent logs images to /act/mnt/<jobid>._Log_1, /act/mnt/<jobid>._Log_2, and so on.

5. Click **Submit**. The job runs as soon as the scheduler has an opening, often immediately. You can go to the System Monitor to view the progress and details of the job.

![Mount Job Details for an Oracle Database Image in the AGM](image-url)
Mounting an Oracle Database Image Protected Under a File System for Data Access from the AGM

To mount an Oracle database image for data access:

1. Open the AGM to the Application Manager and enter the database application name or use the filters to make it easier to get to the database image that you need.
2. Right-click the application and select Access.
3. On the Access page, select the desired image and click Mount under the Mount menu.
4. On the Mount page, fill in the required information.
   
   - Under **Target**, select the host for the newly mounted database. The requested information changes depending on whether you select a physical host, a VM as a vRDM, or a VM as a pRDM.
   - Provide a label as needed. This is optional.
   - Deselect **Create New Virtual Application**. If you want to make an application aware mount, then follow the procedure in **Mounting an Oracle Database as a Virtual Application in the AGM** on page 72.

![Mounting an Oracle Database to a VM in the AGM](image)

**Mapping Options**

<table>
<thead>
<tr>
<th>Host Type</th>
<th>Mapping Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>VM</td>
<td>Map to All ESX Hosts: Mapping staging disks to more than one ESX host in cluster ensures that VM can fail over to another ESX host in the event of an ESX host failure.</td>
</tr>
<tr>
<td>VM</td>
<td>Mount Mode: physical compatibility RDM (pRDM) or virtual compatibility RDMs (vRDM)</td>
</tr>
<tr>
<td>VM (vRDM)</td>
<td>Mark Dependent: A vRDM can be dependent or independent.</td>
</tr>
<tr>
<td>All</td>
<td>If necessary, change the default storage pool from the <strong>Storage Pool</strong> drop-down list.</td>
</tr>
<tr>
<td>All</td>
<td>Select a <strong>Mount Location</strong>: Enter the full path at which you want to mount the volume.</td>
</tr>
</tbody>
</table>

- If the path exists as an empty folder, the Actifio Connector will use it.
- If it does not exist, the Connector will create it.
- If it exists as a file or as a folder that is not empty, then the job will fail.
If there are multiple volumes to be mounted, then the Connector uses:

<table>
<thead>
<tr>
<th>Volume(s)</th>
<th>Mount Point</th>
<th>No Mount Point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Database Image</td>
<td>/&lt;mountpoint&gt;</td>
<td>/act/mnt/&lt;jobid&gt;</td>
</tr>
<tr>
<td>Logs Image</td>
<td>/&lt;mountpoint&gt;_Log and subsequent logs images to /act/mnt/&lt;jobid&gt;_Log_1, /&lt;mountpoint&gt;_Log_2, and so on</td>
<td>/act/mnt/&lt;jobid&gt;_Log and subsequent logs images to /act/mnt/&lt;jobid&gt;_Log_1, /act/mnt/&lt;jobid&gt;_Log_2, and so on</td>
</tr>
</tbody>
</table>

5. Check **Submit** to submit the job.
Mounting an Oracle Database as a Virtual Application in the AGM

Before You Begin

An Actifio Application Aware mount mounts a captured Oracle database as a virtual application. It allows you to quickly bring a database online without having to actually move the data and without having to manually configure a new instance of the database. An Application Aware mount addresses the challenges of creating and managing copies of production databases without manual intervention by database, server, and storage administrators.

**Note:** Oracle virtual applications consume a minimum 300 MB to account for redo logs and the control file.

**Note:** An SSH connection between RAC nodes is required for application aware mount to RAC nodes.

**Note:** The ASM Diskstring parameter must be set on any target server. See The ASM diskstring Parameter Must Be Set on page 23.

Patching Oracle 12c

Actifio Application Aware mounts may fail if your Oracle 12c installation does not include this patch, which can be downloaded from the Oracle support portal:

Oracle Database 12c Bug# 19404068 (ORA-1610 ON RECOVER DATABASE FOR CREATED CONTROLFILE)

- (Patch 19404068) Linux x86-64 for Oracle 12.1.0.2.0
- (Patch 19404068) IBM AIX on POWER Systems (64-bit) for Oracle 12.1.0.2.0
- (Patch 19404068) Solaris on SPARC (64-bit) for Oracle 12.1.0.2.0

To see if the patch is installed, run:
```
$ cd $ORACLE_HOME/OPatch
$ ./opatch lsinventory -details
$ ./opatch lsinventory -details | grep 19404068
```

Pre-checks to Mount an Oracle Database as a Virtual Application

- Make sure that the source and target host database versions match, and make sure that there are enough resources (like memory & CPU) on the target database server to meet your performance requirements.

Mounting an Oracle Database as a Virtual Application

To mount an Oracle database as a virtual application:

1. Start mounting the image as detailed in Mounting an Oracle Database Image Protected Under a File System for Data Access from the AGM on page 69. Under Application Options, enable Create New Virtual Application.

2. Fill in the form as needed for this virtual application. Fields marked with an asterisk (*) are required. You can click on each entry for additional helpful information.
Application Options

- **Roll Forward Time**: Select the time of the image that you want to roll forward to.
- **Target Database SID**: Specify the SID for the new Oracle database to be provisioned on the target. Follow standard Oracle naming conventions for this value. Make sure that the target host database version matches the version of the source host, and that there are enough resources on the target database server. Follow standard Oracle naming conventions for this value.
- **User Name**: Specify Oracle Operating System user credentials on the target.
- **Oracle Home Directory**: Specify the Oracle Home Directory ($ORACLE_HOME) on the target database server.
- The application aware mount will be a new database. If you want to protect the new database, then enable **Manage New Application** to apply an SLA to the new database. New Template and Profile fields will appear where you can select any of your existing SLA templates and resource profiles. The application aware mount will be a new database. You can have the new database protected by applying an SLA when you create the new database. The snapshots of the database are incremental unless you apply a policy template with Force Out-of-Band Backup checked.

**Note**: There is one exception to this: if the target server is a VMware VM, you must select "pRDM" when performing the mount if you want the child database to have the efficient incremental snapshots. If you forget and leave the default of "vRDM", then the first snapshot job will be a full backup.

Advanced Options

- **Password**: A password is required for Oracle 12c on Windows (only).
- **TNS Admin Directory path**: Specify TNS_ADMIN Directory path (path of tnsnames.ora file) on the target database server.
- **Database Memory Size in MB**: Database total memory size, in MB, for the database being provisioned on the target. See the table below for the expected behavior depending on how this and SGA% (next) are set.
- **SGA%**: Parameter to configure SGA/PGA memory, as a percentage of total memory, for the database being provisioned. See the table below for the expected behavior depending on how this and Database Memory Size in MB (above) are set.

<table>
<thead>
<tr>
<th>Database Memory Size in MB</th>
<th>SGA%</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>not specified</td>
<td>N/A</td>
<td>Total database memory size and memory parameter on target will be the same as source database.</td>
</tr>
<tr>
<td>specified</td>
<td>not specified</td>
<td>MEMORY_TARGET parameter will be set for the database being provisioned on the target.</td>
</tr>
<tr>
<td>specified</td>
<td>specified</td>
<td>Set SGA and PGA for the database provisioned on the target to: SGA_TARGET = Database Memory Size in MB x (SGA%/100) PGA_TARGET = Database Memory Size in MB x (100-SGA%/100)</td>
</tr>
</tbody>
</table>

**Note**: Do not set SGA to 100. To avoid database slowness, be sure to reserve some memory space for PGA.
- **REDO Size**: Parameter to configure REDO size, in MB, for the database being provisioned. If not specified, REDO size is be set to 1000 MB.

- **Shared_Pool_Size in MB**: Parameter to configure shared pool size, in MB, for the database being provisioned. If not specified, shared_pool_size will not be used.

- **DB_Cache_Size in MB**: Parameter to configure database cache size, in MB, for the database being provisioned. If not specified, db_cache_size will not be used.

- **DB_Recovery_File_Dest_Size in MB**: Parameter to configure database recovery file destination size, in MB, for the database being provisioned. If not specified, db_recovery_file_dest_size will be set to 50000 MB.

- **Diagnostic_Dest**: Parameter to configure diagnostic destination on the host. If not specified, diagnostic_dest will be set to ORACLE_HOME.

- **Max number of processes**: Parameter to configure max number of system user processes that can simultaneously connect to Oracle, for the database being provisioned. If not specified, processes will be set to 500.

- **Max number of open cursors**: Parameter to configure maximum number of open cursors that a session can have at once, for the database being provisioned. If not specified, number of open cursors will be using source database settings.

- **Character set**: Parameter to configure character set encoding, for the database being provisioned. If not specified, AL32UTF8 will be used.

- **TNS Listener IP**: Specify IP address for the TNS Listener. It can be one of SCAN IP, VIP, or Host IP. If not specified, Host IP will be used.

- **TNS Listener port**: TNS Listener port to be used to create service name under tnsnames.ora for provisioned database on target. If not specified, port 1521 is used.

- **TNS Domain Name**: Specify domain name to be used with service name under tnsnames.ora for provisioned database on target. This is needed when database service is using Domain Name.

- **Do not change database DBID**: If selected, new database's DBID will not be changed.

- **Do not update tnsnames.ora**: If selected, an entry for the new database will not be added to tnsnames.ora. This may require manual intervention for connections to the new database, and in some cases snapshot jobs for the new database will fail without this manual intervention.

- **Number of Channels**: The number of RMAN channels.

- **Clear OS_Authent_Prefix**: OS_Authent_Prefix is a prefix that Oracle uses to authenticate users attempting to connect to the server. Oracle concatenates the value of this parameter to the beginning of the user’s operating system account name and password.

- **Restore with Recovery**: If selected, brings the newly created database online: the provisioned database on target will be open for read and write. This is the default selection.

- **Stand Alone Non-RAC**: This is only applicable for databases where the source database is in a RAC configuration and Actifio stores the copy in ASM format. If selected, this performs an application aware mount to a stand alone ASM non-RAC instance. Do not select this option if a RAC node list has been provided.

- **Environment variable**: If you have any user-defined environment variables to be passed to pre/post scripts, you can enter one here.
Application Aware Oracle Database Mount: Application Options and Advanced Options

3. Click **Submit** to submit the job.
Bringing Actifio-Protected ASM Diskgroups Back Online after Reboot of a Target DB Server

After any database server reboot where Actifio copy is mounted, or Actifio backups are in progress for the database at the time of reboot/crash, please follow the steps to get the Actifio disk group mount back:

1. Check that the target database server is back up and that ASM and RAC system are also up.
2. Restart the Actifio Connector (from root).
3. Set ASM environment.
4. Login to ASM sqlplus and check the disk group status:
   ```sql
   select name, state from v$asm_diskgroup where name = '<dg name>'; 
   ```
5. If unmounted, mount the disk group: `alter diskgroup <dg name> mount;`
6. Login to the Oracle OS and set the database environment, then start the database.
Restoring a Database via the Actifio Desktop, Overwriting the Production Database

To restore an Oracle database out-of-band backup image, overwriting the original production database:

1. Open the Actifio Desktop to the **Application Manager**.
2. In the navigation pane, expand the Oracle list and select the Oracle database to be restored.
3. Under SLA Options, set **Run Schedule** to **No**. This is to prevent a new protection job from starting.

**Turning off the Scheduler for a Database**

4. Click the **Restore** tab. The restore screen for the selected database is displayed.
5. From the calendar tool, select the date/time range in which the database image was taken. If the policy that protected the database had log protection enabled, the backup represents both the database and its logs.
6. Click the **Snapshot** button.
7. Select the backup image to restore from the **Select a backup** on the right. When selected, an icon turns green and detailed information about it is displayed.
8. From the backup instance pull-down menu, select **Restore** and the Restore Job window is displayed.

![Restore Job Window for a Database with Logs](image)

9. Check the **Restore with recovery** option to bring the restored database online in a Read_Write state. If this is unchecked, the database will be left in the Mounted state.

10. If log protection is not enabled for this image, then you do not see the roll-forward window; skip to Step 11. If you have logs and want to use them to roll forward to a specific point in time, then:
   - Select whether to base the dates and times on User time or Host time. User time is relative to the viewer of the current screen. Host time is relative to the system that hosts the data to be restored.
   - From the calendar tool select a date from which to initiate the restore operation.
   - Slide the slider tool to select the point in time to restore to.

11. Enter the Oracle OS user name password credentials.

12. Check **Select All** to restore all volumes.

13. Click **Submit**. A warning dialog appears. Read it and enter **DATA LOSS** to confirm.

14. Another warning appears. Type **OVERWRITE OTHER APPS** to confirm, and click **Start Restore**.

![Read the Warning and Only Type OVERWRITE OTHER APPS if You are Certain](image)

15. If you restored a RAC cluster, then when the restore job is finished, start the database on all RAC nodes.

---

**Note:** When you restore a database, the SLA options (Run Schedule, Expire Data) of the database are disabled.
The procedures to restore a database protected under a file system or an ASM Disk Group have subtle differences described below, but the basic procedure to recover to the point-in-time of the backup snapshot is:

1. Mount the latest database backup snapshot from Actifio back to the Oracle server.
2. Restore the parameter file and the control file.
3. Catalog the database backup snapshot to RMAN.
4. Restore and recover the database using an Actifio mounted backup.

The procedures vary depending upon whether the source database is RAC or non-RAC, whether the database is protected under a file system or under an ASM Disk Group, and whether the archivelog files are Actifio-protected or are not Actifio-protected.

### Six RMAN Procedures to Recover Databases

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAC or Standalone ASM</td>
<td>File System</td>
<td>Logs not Actifio-Protected</td>
<td>Recovering a RAC ASM Oracle Database to a Scheduled Backup Point if the archivelog is Not Protected through Actifio on page 81</td>

</table>

**Note:** Actifio-Protected means that database log protection is enabled in the SLA policy advanced settings.
Recovering a Non-RAC Oracle Database to a Scheduled Backup Point if the archivelog is Not Protected through Actifio

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-RAC, Non-ASM</td>
<td>File System</td>
<td>Not Actifio-Protected</td>
</tr>
</tbody>
</table>

To recover a non-RAC Oracle database for point-in-time recovery if the logs are not protected by Actifio:

1. Mount the image from the source database server to recover. In the Mount window, provide a mount point for the image, for example: /acttestdb. For instructions on how to mount a database image, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.

2. Set the Oracle environment, and use sqlplus to shut down the database:

   sqlplus / as sysdba
   sql> shutdown immediate;

   Verify that the database is shut down. Kill any orphan process for the database.

   ps -ef | grep <db name>

3. Create a new spfile from the existing pfile and restart the database:

   Start the database in nomount state using the parameter file from the mounted volume. The parameter file will be under a top mounted folder, for example: /acttestdb

   sqlplus / as sysdba
   sql> startup nomount pfile='/acttestdb/<database sid>___backup.ora';

   Create an spfile from the pfile:

   sql> create spfile='$ORACLE_HOME/dbs/spfile<database sid>.ora' from pfile='/acttestdb/<database sid>___backup.ora';

   Restart the database in nomount state with the new spfile:

   sql> shutdown immediate;
   sql> startup nomount;

4. Use RMAN to restore the control file from the Actifio mounted volume:

   rman target /
   rman> restore controlfile from '/acttestdb/cf-D_<sid>-id_<id>.ctl';

5. Mount the database:

   rman> alter database mount;

6. Catalog the datafile and archivelog folder from the Actifio mounted volume to RMAN:

   rman> run { catalog start with '/acttestdb/datafile' noprompt;
   catalog start with '/acttestdb/archivelog' noprompt; }

7. Restore and recover the database:

   rman> run { restore database ; recover database ; }

   **Note:** Ignore any warning from RMAN looking for the next archivelog as this is a point-in-time recovery.

8. Open the database with the reset log option:

   rman> alter database open resetlogs;

The database is available for read and write.
Recovering a RAC ASM Oracle Database to a Scheduled Backup Point if the Archivelog is Not Protected through Actifio

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAC or Standalone ASM</td>
<td>File System</td>
<td>Not Actifio-Protected</td>
</tr>
</tbody>
</table>

To recover a standalone ASM or RAC Oracle database for point-in-time recovery if the logs are not Actifio-protected:

1. Mount the image from the source database server to recover. In the Mount window, provide a mount point for the image, for example: `/acttestdb`. For instructions on how to mount a database image, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.

2. Shut down the Oracle database.
   From node 1, su to the Oracle OS user:
   ```
   su - oracle
   ```
   Set the Oracle environment and use `srvctl` to stop the database across all nodes:
   ```
   srvctl stop database -d <database name>
   ```
   Verify that the database is shut down on all nodes. Kill any orphan process for the database.
   ```
   ps -ef | grep <db name>
   ```

3. Start the database in nomount state using the parameter file from the mounted volume. The parameter file will be under a top mounted folder for example: `/acttestdb`
   ```
   sqlplus / as sysdba
   sql> startup nomount pfile='/acttestdb/<db name>___backup.ora';
   ```

4. Create a new `spfile` and restart the database:
   To get the path of original `spfile` under disk group:
   ```
   cat $ORACLE_HOME/dbs/init<database sid>.ora
   ```
   For example: `spfile=<preferred disk group>/<db name>/spfile<db name>.ora`
   ```
   sql> create spfile='+<preferred disk group>/<db name>/spfile<db name>.ora' from pfile='/acttestdb/<db name>___backup.ora';
   ```
   Restart the database with `spfile` in nomount state:
   ```
   sql> shutdown immediate;
   sql> startup nomount;
   ```

5. Restore the control file using RMAN from the Actifio mounted volume.
   ```
   rman target /
   rman> restore controlfile from '/acttestdb/cf-D_<db name>-id_<id>.ctl';
   ```

6. Mount the database:
   ```
   rman> alter database mount;
   ```

7. Catalog the datafile and archivelog folder from Actifio mounted volume to RMAN:
   ```
   rman> run { catalog start with '/acttestdb/datafile' noprompt; catalog start with '/acttestdb/archivelog' noprompt; }
   ```

8. Restore and recover the database:
   ```
   rman> run { restore database ; recover database ; }
   ```
**Note:** Ignore any warning from RMAN looking for the next archivelog as this is a point-in-time recovery.

9. Open the database with the reset log option:
   ```sql
   rman> alter database open resetlogs;
   ```

10. Shutdown the database on node 1 and start the database across all nodes.
    Use sqlplus to shut down the database:
    ```sql
    sqlplus / as sysdba
    sql> shutdown immediate;
    ```
    Use srvctl to start database across all nodes:
    ```
    srvctl start database -d <database name>
    ```
    The database is available for read and write.
Recovering a Non-RAC Oracle Database to a Scheduled Backup Point with Roll-Forward of Actifio-Protected archivelog

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-RAC, Non-ASM</td>
<td>File System</td>
<td>Actifio-Protected</td>
</tr>
</tbody>
</table>

To recover a non-RAC Oracle database for point-in-time recovery if the logs are Actifio-protected:

1. Mount the image from the source database server to recover. In the Mount window, provide a mount point for the image, for example: `/acttestdb`. For instructions on how to mount a database image, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.

   The database backup image will be mounted at: `/acttestdb`

   The protected archive log will be mounted at: `/acttestdb_Log`

   With high growth in archive generation, the protected archive image mount can be more than one mount, for example:

   `/acttestdb_Log`
   `/acttestdb_Log_1`

2. Set the Oracle environment and use sqlplus to shut down the database:

   sqlplus / as sysdba
   sql> shutdown immediate;

   Verify the database is shut down. Kill any orphan process for the database.

   ps -ef | grep <db name>

3. Start the database in nomount state using the backup parameter file from the mounted volume. The backup parameter file will be under top mounted folder, for example `/acttestdb`

4. Set the Oracle environment and use sqlplus to start the database:

   sqlplus / as sysdba
   sql> startup nomount pfile='/acttestdb/<database sid>___backup.ora';

5. Create a new spfile from the existing pfile and restart the database.

   Create an spfile from the pfile:

   sql> create spfile='$ORACLE_HOME/dbs/spfile<database sid>.ora' from pfile='/acttestdb/<database sid>___backup.ora';

   Restart the database with spfile in nomount state:

   sql> shutdown immediate;
   sql> startup nomount;

6. Restore the control file using RMAN from the Actifio mounted archive log image. Use the latest control file from Log mounted image, for example: `/acttestdb_Log/cf-D_<sid>-id_<id>.ctl` or if more than one log image: `/acttestdb_Log_1/cf-D_<sid>-id_<id>.ctl`

   rman target /
   rman> restore controlfile from '/acttestdb_Log_1/cf-D_<sid>-id_<id>.ctl';

7. Mount the database:

   rman> alter database mount;

8. Catalog the datafile and archivelog folder from Actifio mounted database image and archive log image to RMAN
rman> run { catalog start with '/acttestdb/datafile' noprompt;
catalog start with '/acttestdb/archivelog' noprompt;
catalog start with '/acttestdb_Log' noprompt; }

9. Restore and recover the database:
   rman> run { restore database ; recover database ; }
   For a specific point in time recovery using the format yyyymmddhh24mi:
   rman> run
   {
      restore database;
      recover database until time "to_date('<desired time stamp>','yyyyymmddhh24mi')";
   }

10. Open the database with the reset log option:
    rman> alter database open resetlogs;

    The database is available for read and write.
Recovering a RAC ASM Oracle Database to a Scheduled Backup Point with Roll-Forward of Actifio-Protected archivelog

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAC or Standalone ASM</td>
<td>File System</td>
<td>Actifio-Protected</td>
</tr>
</tbody>
</table>

To recover a standalone ASM or RAC Oracle database for point-in-time recovery if the logs are Actifio-protected:

1. Mount the image from the source database server to recover. In the Mount window, provide a mount point for the image, for example: /acttestdb. For instructions on how to mount a database image, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.

   The database backup image will be mounted at the mount point: /acttestdb

   The protected archive log will be mounted at: /acttestdb_log

   With high growth in archive generation, the protected archive image mount can be more than one mount, for example:

   /acttestdb_log
   /acttestdb_log_1

2. Shut down the Oracle database. From node 1, su to Oracle OS user:

   su - oracle

   Set the Oracle environment and use srvctl to stop the database across all nodes:

   srvctl stop database -d <database name>

   Verify the database is shutdown (all nodes). Kill any orphan process for the database.

   ps -ef | grep <db name>

3. Start the database in no-mount state using the backup parameter file from the mounted volume. The backup parameter file will be under the top mounted folder, for example at /acttestdb

4. Set the Oracle environment and use sqlplus to start the database:

   sqlplus / as sysdba

   sql> startup nomount pfile='/acttestdb/<db name>___backup.ora';

5. Create a new spfile and restart the database.

   To get the path of original spfile under disk group:

   cat $ORACLE_HOME/dbs/init<database sid>.ora

   For example: spfile=<preferred disk group>/<db name>/spfile<db name>.ora

   sql> create spfile='+<preferred disk group>/<db name>/spfile<db name>.ora' from pfile='/acttestdb/<db name>___backup.ora';

   Restart the database with spfile in nomount state:

   sql> shutdown immediate;

   sql> startup nomount;

6. Restore the control file using RMAN from the Actifio mounted archive log image. Use the latest control file from the Log mounted image (for example: /acttestdb_Log/cf-D_<db name>-id_<id>.ctl or if more than one log image: /acttestdb_Log_1/cf-D_<db name>-id_<id>.ctl

   rman target /

   rman> restore controlfile from '/acttestdb_Log_1/cf-D_<db name>-id_<id>.ctl';
7. Mount the database:
   
   `rman> alter database mount;`

8. Catalog the datafile and archivelog folder from Actifio mounted database image and archive log image to RMAN:
   
   `rman> run { catalog start with '/acttestdb/datafile' noprompt;
   catalog start with '/acttestdb/archivelog' noprompt;
   catalog start with '/acttestdb_Log' noprompt;}`

9. Restore and recover the database:
   
   `rman> run { restore database ; recover database ; }`

   For a specific point in time recovery using the format `yyyymmddhh24mi`:
   
   `rman> run
   { restore database;
   recover database until time "to_date('<desire time stamp>','yyyymmddhh24mi');"; }
   `}

10. Open the database with the reset log option:

    `rman> alter database open resetlogs;`

11. Shutdown the database on node 1 and start the database across all nodes.

    Use sqlplus shut down the database:

    `sqlplus / as sysdba
    sql> shutdown immediate;`

    Use srvctl to start database across all nodes:

    `srvctl start database -d <database name>`

The database is available for read and write.
Recovering an Oracle Database to a Scheduled Backup Point if the archivelog is not Protected through Actifio

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAC or Standalone ASM</td>
<td>ASM Disk Group</td>
<td>Not Actifio-Protected</td>
</tr>
</tbody>
</table>

To recover a standalone ASM or RAC Oracle database for point-in-time recovery if the logs are not protected by Actifio:

1. Mount the image from the source database server to recover. In the Mount window, provide a preferred disk group for the image mount under ASM on RAC Node 1. For details on how to mount a database image, see Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44.

   For example, on the mount screen:
   - Select Host: RAC node 1 database server
   - Preferred disk group: acttestdg
   - RAC node list: IP of RAC node 1

   The backup parameter file will be copied under /act/touch/<Preferred disk group>, for example:
   /act/touch/acttestdg/<db name>___backup.ora

2. Shut down the Oracle database. From node 1, su to Oracle OS user:

   su - oracle

   Set the Oracle environment and use srvctl to stop the database across all nodes:

   srvctl stop database -d <db name>

   Verify database is shut down (all nodes in case of RAC). Kill any orphan process for the database.

   ps -ef | grep <db name>

3. Start the database in nomount state using the backup parameter file from the mounted volume. The backup parameter file will be under the top mounted folder, for example at /act/touch/acttestdg/

4. Set the Oracle environment. Use sqlplus to start the database:

   sqlplus / as sysdba

   sql> startup nomount pfile='/act/touch/acttestdg/<db name>___backup.ora';

5. Create a new spfile and restart the database.

   To get the path of original spfile under disk group:

   cat $ORACLE_HOME/dbs/init<database sid>.ora

   For example: spfile=+/<preferred disk group>/<db name>/spfile<db name>.ora

   sql> create spfile='+/<preferred disk group>/<db name>/spfile<db name>.ora' from pfile='/act/touch/acttestdg/<db name>___backup.ora';

   Restart the database with spfile in nomount state:

   sql> shutdown immediate;
   sql> startup nomount;

6. Restore control file using RMAN from the Actifio mounted volume.

   rman target /
   rman> restore controlfile from '++<preferred disk group>/<db name>/cf-D_<db name>-id_<id>.ctl' ;

7. Mount the database:
8. Catalog the datafile and archivelog folder from Actifio mounted ASM disk group to RMAN
   rman> run { catalog start with '+acttestdg/<db name>/datafile' noprompt;
   catalog start with '+acttestdg/<db name>/archivelog' noprompt; }

9. Restore and recover the database:
   rman> run { restore database ; recover database ; }

10. Open the database with the reset log option:
    rman> alter database open resetlogs;

11. Shutdown the database on node 1 and start the database across all nodes.
    Use sqlplus to shut down the database:
    sqlplus / as sysdba
    sql> shutdown immediate;
    Use srvctl to start database across all nodes:
    srvctl start database -d <database name>

The database is available for read and write.
Recovering an Oracle Database to a Scheduled Backup Point with Roll-Forward of Actifio-Protected archivelog

<table>
<thead>
<tr>
<th>Source Database</th>
<th>Protected Under</th>
<th>Archivelog is</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAC or Standalone ASM</td>
<td>ASM Disk Group</td>
<td>Actifio-Protected</td>
</tr>
</tbody>
</table>

To recover a standalone ASM or RAC Oracle database for point-in-time recovery if the logs are not protected by Actifio:

1. Mount the image from the source database server to recover. In the Mount window, provide a preferred disk group for the image mount under ASM on RAC Node 1. For details on how to mount a database image, see Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44. For example, on the mount screen:
   - Select Host: RAC node 1 database server
   - Preferred disk group: acttestdg
   - RAC node list: IP of RAC node 1

   The backup parameter file will be copied under /act/touch/<Preferred disk group>, for example:
   `/act/touch/acttestdg/<db name>___backup.ora`

2. Shut down the Oracle database.
   - From node 1, su to Oracle OS user:
     `su - oracle`
   - Set the Oracle environment. Use srvctl to stop database across all nodes:
     `srvctl stop database -d <db name>`
   - Verify the database is shut down (on all nodes). Kill any orphan process for the database.
     `ps -ef | grep <db name>`

3. Start the database in nomount state using the backup parameter file copied under /act/touch/acttestdg

4. Set the Oracle environment. Use sqlplu to start the database:
   - `sqlplus / as sysdba`
   - `sql> startup nomount pfile='/act/touch/acttestdg/<db name>___backup.ora';`

5. Create a new spfile and restart the database.
   - To get the path of original spfile under disk group:
     `cat $ORACLE_HOME/dbs/init<database sid>.ora`
   - For example: `spfile=+<preferred disk group>/<db name>/spfile<db name>.ora`

   - `sql> create spfile='+<preferred disk group>/<db name>/spfile<db name>.ora' from pfile='/act/touch/acttestdg/<db name>___backup.ora';`

   - Restart the database with spfile in nomount state:
     - `sql> shutdown immediate;`
     - `sql> startup nomount;`

6. Restore control file using RMAN from the Actifio mounted archive log image. Use the latest control file from Log mounted image (for example: `/acttestdb_Log/cf-D_<db name>-id_<id>.ctl` or if more than one log image exists: `/acttestdb_Log_1/cf-D_<db name>-id_<id>.ctl`

   - `rm目标 target /
   - rman> restore controlfile from '/acttestdb_Log_1/cf-D_<db name>-id_<id>.ctl' ;`
7. Mount the database:
   ```sql
   rman> alter database mount;
   ```

8. Catalog the datafile and archivelog folder from Actifio mounted database image and archive log image to RMAN:
   ```sql
   rman> run { catalog start with '+acttestdg/<db name>/datafile' noprompt;
               catalog start with '+acttestdg/<db name>/archivelog' noprompt;
               catalog start with '/acttestdg_Log' noprompt;}
   ```

9. Restore and recover the database:
   ```sql
   rman> run { restore database ; recover database ; } 
   ```
   For a specific point in time recovery run the recover command as under:
   ```sql
   rman> run 
   {
   restore database;
   recover database until time "to_date('<desired time stamp>','yyyymmddhh24mi')";
   }
   ```

10. Open the database with the reset log option:
    ```sql
    rman> alter database open resetlogs;
    ```

11. Shutdown the database on node 1 and start the database across all nodes.
    Use sqlplus to shut down the database:
    ```sql
    sqlplus / as sysdba
    sql> shutdown immediate;
    ```
    Use srvctl to start the database across all nodes:
    ```bash
    srvctl start database -d <database name>
    ```
    The database is available for read and write.
To recover a single tablespace data file, for example, due to data corruption:

1. Mount the latest database snapshot from the Actifio appliance back to the Oracle server.
2. Catalog the database backup snapshot to RMAN.
3. Restore and recover the tablespace using the backup snapshot as detailed below.

This section contains procedures for:

- Recovering a Single Tablespace of a Production Database on an ASM Disk Group on page 91
- Recovering a Corrupt Database Block on page 92
- Recovering Lost Control Files on page 93
- Recovering an Oracle Pluggable Database on page 94

Recovering a Single Tablespace of a Production Database on an ASM Disk Group

To recover a single tablespace of production database to the primary node:

1. Mount the database point-in-time snapshot as detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.
2. In the Mount window, provide a mount point for the image. For example, for an image under ASM disk group provide a disk group name under Preferred Disk Group and for image under file system provide a Mount Point ex: /acttestdb.
   - For instructions on how to mount a database image protected under file system, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.
   - For details on how to mount a database image protected under ASM Disk Group: see Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44.
3. From the primary node, log into the database server as Oracle OS user.
4. Set the database environment and log into RMAN:

   ```
   rman target /
   ```
5. At the RMAN prompt, catalog the backup data file and archive log folder:

   Example: A database image protected under ASM Disk Group:
   (Mounted ASM Disk Group name ‘+acttestdg’):

   ```
   rman> catalog start with '+acttestdg/<db name>/datafile' noprompt;
   rman> catalog start with '+acttestdg/<db name>/archivelog' noprompt;
   rman> catalog start with '/<mountpoint_log>' noprompt; (If archivelogs are protected by Actifio)
   ```

   Example: A database image protected under file system (mounted file system name '/acttestdb'):

   ```
   rman> catalog start with '/acttestdb/datafile' noprompt;
   ```
rman> catalog start with '/acttestdb/archivelog' noprompt;
rman> catalog start with '/acttestdb_log/archivelog' noprompt; (If archivelogs are protected by Actifio)

Now you can run all RMAN recovery commands, such as:
  o Recovering a Tablespace
  o Recovering a Datafile
  o Recovering a Corrupt Database Block
  o Recovering Lost Control Files
  o Recovering an Oracle Pluggable Database on page 94

6. When finished, unmount and delete the image from the Actifio Desktop.

Recovering a Tablespace
To recover a tablespace:
  rman> restore tablespace <tablespace name>;
  rman> recover tablespace <tablespace name>;

Recovering a Datafile
To recover a datafile
  rman> restore datafile <file#>;
  rman> recover datafile <file#>;

Recovering a Corrupt Database Block
To recover a corrupt database block:

1. Mount the database point-in-time snapshot as detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.

2. In the Mount window, provide a mount point for the image. For example, for an image under ASM disk group provide a disk group name under Preferred Disk Group and for image under file system provide a Mount Point ex: /acttestdb.
   o For instructions on how to mount a database image protected under file system, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.
   o For details on how to mount a database image protected under ASM Disk Group: see Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44.

3. From the primary node, log into the database server as Oracle OS user.

4. Set the database environment and log into sqlplus, then query v$database_block_corruption to check the corrupt blocks:
   sqlplus / as sysdba
   sql> SELECT * FROM V$DATABASE_BLOCK_CORRUPTION;

5. Login to RMAN to recover all corrupted blocks:
   rman target /
   rman> RECOVER CORRUPTION LIST;
   After the blocks are recovered, the database removes them from V$DATABASE_BLOCK_CORRUPTION.

6. To recover an individual corrupt block (ex: datafile 8 and block 13):
   From RMAN prompt
   RMAN> recover datafile 8 block 13;
Recovering Lost Control Files

To recovering lost control files:

1. Mount the database point-in-time snapshot as detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.

2. In the Mount window, provide a mount point for the image. For example, for an image under ASM disk group provide a disk group name under Preferred Disk Group and for image under file system provide a Mount Point ex: /acttestdb.
   - For instructions on how to mount a database image protected under file system, see Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.
   - For details on how to mount a database image protected under ASM Disk Group: see Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44.

3. From the primary node, log into the database server as Oracle OS user.

4. Set the database environment and log into sqlplus, then shut down the database and start in nomount state:
   - For standalone database:
     sqlplus / as sysdba
     sql> shutdown immediate;
     sql> startup nomount;
   - For RAC database from the mounted image node shutdown the database across all nodes:
     srvctl stop database -d <dbname>
     sql> startup nomount;

5. Restore the control file from Actifio mounted image as above.
   For example: /acttestdb (Filesystem) and +acttestdg (for ASM)
   rman target /
   rman> restore controlfile from '/acttestdb/cf-D_<db name>-id_<id>.ctl' ; (Filesystem mount)
   rman> restore controlfile from '+acttestdb/cf-D_<db name>-id_<id>.ctl' ; (ASM mount)

6. Mount and open the database from sqlplus:
   sqlplus / as sysdba
   sql> alter database mount;
   sql> recover database until cancel;
   sql> alter database open resetlogs;
Recovering an Oracle Pluggable Database

To recover an Oracle 12c pluggable database (PDB):

1. Mount the image from the source database server to recover. In the Mount window, provide a preferred disk group for the image mount under ASM on RAC Node 1. For details on how to mount a database image, see Mounting an Oracle Database Image Protected Under an ASM Disk Group for Data Access on page 44.

2. Close the pluggable database
   a. From Node 1, su to Oracle User
      ```
su - oracle
      ```
   b. Set the Oracle environment. Connect to the Oracle database as “sysdba” user
      ```
      sqlplus / as sysdba
      SQL> alter pluggable database <Pluggable DB name> close;
      ```

3. Catalog the datafile and archivelog folder from Actifio mounted database image and archive log image to RMAN:
   ```
   rman> run { catalog start with '+acttestdg/<db name>/datafile' noprompt;
   catalog start with '+acttestdg/<db name>/archivelog' noprompt;
   catalog start with '/acttestdg_Log' noprompt;
   }
   ```

4. Restore and Recover the Pluggable database
   ```
   rman> run
   {
   restore pluggable database <Pluggable DB name>;
   recover pluggable database <Pluggable DB name> until time "to_date('<desired time stamp>','yyyymmddhh24mi')";
   }
   ```

   **Note:** These steps are applicable only for Oracle 12.1.0.2 version and above. If Oracle version is 12.1.0.1 or below 12.1.0.2, then recovery of all datafiles belong to the Pluggable database must be performed after before executing Step 5. For example: `rman> recover datafile <PDB datafile number>;

5. Open the Pluggable database:
   ```
rman> alter pluggable database <Pluggable DB name> open;
   ```
The Pluggable database is open for read and write.
12 Instant Oracle Database Recovery or Migration Using ASM Switch and Rebalance

You can also perform this procedure much more easily through the Actifio Global Manager; see Chapter 13, Performing an Oracle ASM Switch and Rebalance via the Actifio Global Manager.

Use this in case of storage failure or to migrate a database to new storage. There are five steps to this procedure:

1. **Stop the Database to be Recovered on All Nodes** on page 95.
2. **Select and Mount an Image** on page 95.
3. **Switch the Database to the Newly Mounted Disk Group** on page 96.

   At this point the database is up and running in its original configuration on Actifio storage. Now you can migrate the database back to production storage or to new storage.
4. **Migrate the Database Back to Production Storage (Rebalance Operation)** on page 98.
   
   After the database migration, clean up the no-longer-needed mounted images.
5. **Unmount and Delete Actifio Mounted Images Used for the ASM Rebalance Operation** on page 98.

**Stop the Database to be Recovered on All Nodes**

1. From the protected node, log in as Oracle OS user and set the database environment.

   `srvctl stop database -d <DB Name>`

2. (Optional) If you want to retain the production disk group name post-recovery, then connect to the ASM instance on each non-primary node and dismount the disk group:

   `SQL> alter diskgroup <DG name> dismount;`

   Then connect to the ASM instance on the primary node and drop the ASM diskgroup:

   `SQL> drop diskgroup <DG name> including contents;`

   To list and check the existing disk path for diskgroup:

   ```
   set lines 200
   set pages 500
   col name format a15
   col path format a25
   select PATH from v$asm_disk where group_number in (select group_number from v$asm_diskgroup where name in upper('<disk group name','disk group name') ) order by group_number
   ```

**Select and Mount an Image**

3. Mount the image as described in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop. Mount the image to all RAC nodes of the source database. During the mount, select node 1 as the target host and under RAC Node List provide the IP of the RAC nodes in order node1:node2:node3. The first IP address in RAC Node list must be the selected host’s IP address.

   **Note:** (AIX only) When using an iSCSI connection, an ASM Disk Group can be mounted to only one node in an Oracle ASM RAC environment on AIX.
Switch the Database to the Newly Mounted Disk Group

This script can be run as root OS user, Oracle OS user, or service account user. The behavior of the script running as different OS user is:

**Root OS user**: Script will not prompt for any OS user password. The script will use `su` to Oracle and grid user account to run the required commands.

**Oracle OS user**: Script will prompt for grid OS user password if the grid account is not using the Oracle OS user (Oracle database instance and ASM instance is not running under Oracle OS user).

**Service account user**: Script will prompt for Oracle OS user and grid OS user password.

4. From the protected node:

**To run the script as root OS user**:

Login as root OS user.

```
cd to script folder /act/act_scripts/asmrestore
change permission to 755
chmod -R /act/act_scripts/asmrestore
```

or:

**To run the script as an Oracle OS user or as a service account user**:

- Login as OS user.
- Create a folder `tempASMRestore`

```
mkdir tempASMRestore
cd tempASMRestore
```
- Copy the ASM restore script to this local folder

```
cp /act/act_scripts/asmrestore/*
```

- Change permission to 755

```
chmod -R *
```

5. In the same folder, edit the `asm_node_config.conf` file to create the list of RAC nodes to switch, restore, and start the database on all nodes. Each line should have only one node entry. For example for a 3 node RAC add one line for each node to `asm_node_config.conf`:

```
ASM_NODE1:rhel137-14.dev.actifio.com
ASM_NODE2:rhel137-15.dev.actifio.com
ASM_NODE3:rhel137-16.dev.actifio.com
```

6. Run the `ASMOOracleRestore.sh` script.

```
ASMOOracleRestore.sh uses 5 required and two optional input parameters:
usage: ASMOOracleRestore.sh <Oracle Home path> <Disk Group Name> <Oracle User> <Grid User> <standalone yes/no> <log mount path> <timestamp yyyyymmddhh24mi>
```

For example:

```
ASMOOracleRestore.sh /home/oracle/app/oracle/product/11.2.0/dbhome_1 DATA1 oracle grid no /act/mnt/vdbxlog 201404021435
```

**Note**: "log mount path", and "timestamp" are optional parameters that should be used only when the database and archive log are both protected using a policy with log protection enabled.
The production database will be up and running in the same configuration as the source database was in when the Actifio presented copy snapshot was taken.

<table>
<thead>
<tr>
<th>log mount path</th>
<th>timestamp</th>
<th>behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>not provided</td>
<td>not provided</td>
<td>Database will be recovered to the database backup point.</td>
</tr>
<tr>
<td>provided</td>
<td>not provided</td>
<td>Database will be recovered to the database backup point. and Archive log will be rolled forward to all available logs under the log mount path.</td>
</tr>
<tr>
<td>provided</td>
<td>provided</td>
<td>Database will be recovered to the database backup point. and Archive log will be rolled forward to the provided timestamp under the log mount path. The timestamp format is yyyymmddhh24mi.</td>
</tr>
</tbody>
</table>
Migrate the Database Back to Production Storage (Rebalance Operation)

From the protected node, use the same OS user account and script directory that were used in Switch the Database to the Newly Mounted Disk Group on page 96. This script can be run as root OS user or Oracle OS user or non-Oracle OS user. The behavior of the script depends upon the role that runs it:

Running the script as:

**Root OS user**: Script will not prompt for any OS user password. The script will use su to Oracle and grid user accounts to run the required commands.

**Oracle OS user**: Script will prompt for grid OS user password if the grid account is not using the Oracle OS user i.e. Oracle database instance and ASM instance is not running under oracle OS user.

**Service account user**: Script will prompt for Oracle OS user and grid OS user password

1. Create a file called *asm_disks.conf*, with the list of disk paths for the production disks to be added to the Actifio mounted disk group for rebalancing. The file should include a single line for each disk path:

   /dev/sda1
   /dev/sdc1

2. Run the script `./asmdgRebalance.sh`

   This script needs 3 input parameters:

   `asmdgRebalance.sh <Disk group Name> <Oracle user> <Grid User>`

   For example: `asmdgRebalance.sh DATA1 oracle grid`

   This script adds the list of disks from *asm_disks.conf* file to the Actifio mounted disk group, performs the rebalance operation, and then drops the Actifio disks from the disk group.

   **Note**: The Oracle ASM rebalance operation uses a range of power (from 1 to 11) to run the rebalance in the background. The Actifio script can run with power of 11. To change the power, edit `asmdgRebalance.sh`

3. To verify the ASM rebalance operation status, run the query below from node 1 as grid OS user.

4. From the script folder, set the ASM environment and connect to sqlplus as sysasm:

   ```sql
   Sqlplus / as sysasm
   SQL> @checkRebalanceOperation.sql
   ```

   When prompted, enter the value for *dg_name*: <Actifio mounted Disk Group name>

5. When finished, unmount and delete the image from the Actifio Desktop.

   **Unmount and Delete Actifio Mounted Images Used for the ASM Rebalance Operation**

   On all RAC nodes:

   1. Login as root user.
   2. cd to */act/touch*
   3. Open the hidden file (dot).

   ```
   <dg_name>_switch_conf
   ```

   (to list the file, run the command `ls -la`)

   4. Set the value of UNMAP to YES: `UNMAP=YES`

   5. Unmount the images from the Actifio Desktop.

   **Note**: Even after a rebalance-based restore is completed and Actifio disks are dropped from the production disk group, Oracle ASM still keeps hold on the underlying block devices for some time. This is due to a known ASM bug. This may result in unmount/delete job failures for some time as the LUNs could not be cleaned from the host gracefully. To work around this ASM issue, retry unmount/delete jobs after some time.
Performing an Oracle ASM Switch and Rebalance via the Actifio Global Manager

You can also perform this procedure through the Actifio Desktop; see Chapter 12, Instant Oracle Database Recovery or Migration Using ASM Switch and Rebalance.

You can protect an Oracle ASM instance either as an Oracle ASM diskgroup or as a filesystem. If the Oracle ASM instance uses an ASM diskgroup as backup destination, you gain the capability for restore and recovery by using ASM switch. This is particularly useful for very large databases where traditional RMAN restore would take too long to satisfy the RTO requirements, since RMAN restore has to physically move data from backup to original diskgroup.

If the database is backed up under file system, then you must use traditional RMAN recovery method detailed in Mounting an Oracle Database Image Protected Under a File System for Data Access on page 46.

**Note:** You can also perform this procedure by using custom scripts, as described in Chapter 12, Instant Oracle Database Recovery or Migration Using ASM Switch and Rebalance. That section details the steps that are automated in this procedure.

**Note:** For the switch and rebalance procedure to work, `/etc/hosts` must be appropriately populated.

The switch and rebalance procedure has two stages:

1. Mounting the image as single diskgroup and then **switching** the database running out of an Actifio mounted diskgroup. You can provide a preferred disk group name which will remain as the production disk group after the rebalance operation where the data gets moved to production storage from Actifio storage.

2. **Rebalancing** moves the data to production storage from Actifio storage. This is an online operation where data movement happens in the background by the Oracle ASM API.

This procedure works for:

- Databases configured as: standalone ASM, single node RAC with ASM, and multi-node RAC with ASM.
- ASM disk groups configured as: database using single disk group for datafile, database using multiple disk group for datafile, and database using multiple disk group and sharing the disk group with another database on the same server.

The RMAN image copy of all data files for the entire database is captured on an Actifio-presented ASM disk group retaining the ASM header information. A snapshot of the staging disk with ASM header information is taken.

To instantly recover an Oracle ASM database from the AGM:

1. Create a candidate ASM diskgroup for the restored database. You can:
   - Enter a new diskgroup name
   - Use the failed diskgroup name: first delete the failed diskgroup and then create a new diskgroup with the same name, and prepare it as an ASM candidate.

2. Open the AGM to the Application Manager.

3. Use the filter feature to search for the desired database and click **Update Filters**.

4. Select the database to be recovered and click **Access**.
Right-Click the Selected Database and Click Access

5. On the Access page, select the desired image and click **Restore** under the Mount menu.

Select the Desired Image and Click Restore

6. On the Restore page, select **ASM Switch**.
7. Select a time if needed.
8. Under **Diskgroup Name**, enter the name of the diskgroup candidate.
Select ASM Switch and Enter the Diskgroup Name

9. Run the **Preflight Check**. The results will point you to any remedial steps.

Address Any Errors, then Run the Pre-Flight Check Again

10. Address any errors, then run the pre-flight check again. When the pre-flight check passes without issues, click **Submit**. You see an informational screen.
11. Click **Restore**. The job begins.

12. You can view progress on the System Monitor in another browser instance. The Job Type is Restore (ASM Switch).

13. When the restore job has finished, go back to the original AGM browser instance and click **OK**.
14. The next step is the rebalance operation. At the top of the window is an ASM Rebalance button. (Beside it is an Undo Switch button in case you have reason to stop this process.) To continue, click the **ASM Rebalance** button.

15. The ASM Rebalance screen appears. You can see the size of the image and the capacity of the available storage devices. When you have selected a storage device that can accommodate the image, the Capacity Required indicator turns green and the ASM Rebalance button turns blue. Now you can proceed.

16. Before starting the ASM Rebalance operation, select a power factor at the bottom of the display. Lower values use fewer system resources, but they take much longer. In a recovery operation, you may want to select the highest value for the fastest results. Select a **Power Factor** and then click **ASM Rebalance**.
17. A screen appears explaining what happens next. Click **Rebalance** to submit the rebalance job.

Submit the Rebalance Job

18. As with the switch job, you can view progress on the System Monitor in another browser instance. The Job Type is Restore (ASM Rebalance).

Waiting for the Rebalance Job to Complete

When the job is finished, the database is ready for use.
Oracle database protection in a Microsoft Windows environment has these two limitations:

- All Oracle databases, both those under file system and those under ASM disk group, are protected under file system only.
- OS Authentication is not available for databases in a Windows environment. In Application Advanced Settings, at Username and Password enter an Oracle user act_rman_user username and password for database authentication. Make sure the database user account has the proper role granted based on the User Role in the Database advanced setting. Application Advanced Settings are detailed in Application Advanced Settings for Oracle Databases on page 32.

This section includes:

- Preparing Oracle Protection in a Windows Environment on page 105
- Identifying Database Instances On Windows on page 106
- Backing Up an Oracle Database in a Windows Environment on page 107
- Watch Script to Watch for Database Volumes Being Mounted on page 108
- Recovering Oracle Databases in a Windows Environment Manually Using RMAN to a Scheduled Backup Point if the archivelog is Not Protected through Actifio on page 109
- Recovering Oracle Databases in a Windows Environment Manually Using RMAN to a Scheduled Backup Point with Roll-Forward of Actifio-Protected archivelog on page 110

Preparing Oracle Protection in a Windows Environment

Before you can discover, protect, and mount out-of-band Oracle databases, be sure to:

1. Check the following settings on the database server:
   a. The Oracle database and the Oracle Listener are up and running (check Windows services).
   b. Confirm that there is a tns entry with the name SID. The file tnsnames.ora is under %ORACLE_HOME%/network/admin
   c. Verify tns entry is valid by running:

   %ORACLE_HOME%/bin/tnsping <SID>

   d. Verify the database is running with spfile. From sqlplus login as sysdba:

   sqlplus / as sysdba
   sql> show parameter spfile;
   e. Verify the database is in archive mode. From sqlplus login as sysdba:

   sqlplus / as sysdba
   sql> archive log list;
2. Get an RMAN user account with “sysdba” and “create session” or “connect” privileges for configuring the RMAN backup. To verify the connection, as Oracle OS user set the ORACLE environment by running from the command line:

   sqlplus <RMAN user account>/<password>@<SID> as sysdba;

3. Enable database change block tracking. With database BCT off, incremental backup time is impacted. Change block tracking feature is available in Oracle Enterprise Edition. Run a SQL query to check that change block tracking is enabled. Run the query:

   sqlplus / as sysdba
   sql> select * from v$block_change_tracking;

Identifying Database Instances On Windows

1. On Windows, to find out what databases are on a host, use:

   reg query HKLM\System\CurrentControlSet\Services | findstr OracleService

2. This returns a line out put that looks like this:

   HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\OracleServiceORCL

3. This shows a database called ORCL. To identify the ORACLE_HOME directory and other details, run:

   reg query HKLM\Software\Oracle /v ORA* /s

4. This returns the following which tells us the ORACLE_HOME directory and whether the database is set to start on boot.

   HKEY_LOCAL_MACHINE\Software\Oracle\KEY_OraDb11g_home1
   \ORACLE_HOME    REG_SZ    D:\oracle\product\11.2.0\dbhome_1
   \ORACLE_HOME_NAME    REG_SZ    OraDb11g_home1
   \ORACLE_GROUP_NAME    REG_SZ    Oracle - OraDb11g_home1
   \ORACLE_BUNDLE_NAME    REG_SZ    Enterprise
   \ORAMTS_CP_TRACE_LEVEL    REG_SZ    0
   \ORAMTS_CP_TRACE_DIR    REG_SZ    D:\oracle\product\11.2.0\dbhome_1\oramts\Trace
   \ORAMTS_CONN_POOL_TIMEOUT    REG_SZ    120
   \ORAMTS_SESS_TXN_TLM_LIVE    REG_SZ    120
   \ORAMTS_NET_CACHE_MAXFREE    REG_SZ    5
   \ORAMTS_NET_CACHE_TIMEOUT    REG_SZ    120000
   \ORAMTS_OSCREDS_MATCH_LEVEL    REG_SZ    OS_AUTH_LOGIN
   \ORACLE_SID    REG_SZ    orcl
   \ORACLE_HOME_KEY    REG_SZ    SOFTWARE\ORACLE\KEY_OraDb11g_home1
   \ORACLE_BASE    REG_SZ    D:\oracle
   \ORA_ORCL_AUTOSTART    REG_EXPAND_SZ    TRUE
   \ORA_ORCL_SHUTDOWN    REG_EXPAND_SZ    TRUE
   \ORA_ORCL_SHUTDOWNTYPE    REG_EXPAND_SZ    immediate
   \ORA_ORCL_SHUTDOWN_TIMEOUT    REG_EXPAND_SZ    90

5. Next, we can see if the database is running, using this command:

   tasklist /SVC | findstr oracle

6. If the instance is started, you should see a line of output like this:

   oracle.exe 1492 OracleServiceORCL
Backing Up an Oracle Database in a Windows Environment

The Actifio Desktop does not yet support OS authentication for Oracle databases in a Windows environment. You can create a username and password inside the database and grant it rights to perform the backup:

1. Launch SQLPlus:
   
   ```
   Set ORACLE_SID=orcl
   sqlplus / as sysdba
   ```

2. Create the user and grant the necessary rights:
   
   ```
   sql> create user ACT_RMAN_USER identified by mypassword;
   sql> grant create session, resource, sysdba to act_rman_user;
   ```

   **Note:** In an Oracle 12c environment, you can grant sysbackup role instead.

3. Check if block change tracking is enabled:
   
   ```
   sql> select * from v$block_change_tracking;
   ```

   If the status is disabled, enable it (optional but recommended for optimal backup performance):
   
   ```
   sql> alter database enable block change tracking using file 'D:\oracle\product\11.2.0\dbhome_1\dbs\orcl.bct';
   ```

4. Check if the log mode is set to Archive Log mode:
   
   ```
   sql> archive log list
   ```

   If the database is in no-archive log mode, then return it to archive log mode:

   **Note:** This will take down the database.

   ```
   sql> shutdown immediate;
   sql> startup mount;
   sql> alter database archivelog;
   sql> alter database open;
   ```

5. Set the Application Advanced Settings. In particular:
   
   - Open the Actifio Desktop or the AGM and enter the database username and password (that we defined above) in the Application Advanced Settings of the database.
   - If the database is under Oracle ASM Disk Group, then set Convert ASM Format to Filesystem Format to **Yes**.

   For full information on Application Advanced Settings, see Application Advanced Settings for Oracle Databases on page 32.

6. In the Actifio Desktop or the AGM, apply an SLA to protect the database.
Watch Script to Watch for Database Volumes Being Mounted

If you create an application-aware mount, then you can use a watch script to show the volumes being mounted from Actifio, and the Oracle processes running. Application-aware mounts are described in Mounting an Oracle Database as a Virtual Application on page 48.

When performing an application-aware mount, you can use this watch script. The script location must be: C:\Program Files\Actifio\scripts. Scripts run on Windows hosts must be .bat or .vbs files.

```
@echo off
:loop
echo. > watchtemp
echo ------------------ >> watchtemp
echo Oracle Processes >> watchtemp
echo ------------------ >> watchtemp
tasklist /svc | findstr oracle >> watchtemp
echo. >> watchtemp
echo ------------------ >> watchtemp
echo Actifio Mounts >> watchtemp
echo ------------------ >> watchtemp
wmic volume get label, name | findstr Actifio >> watchtemp
echo. >> watchtemp
cls
type watchtemp
timeout 2 > null
goto loop
```

Which produces output like this:

```
Oracle Processes
------------------
oracle.exe 1492 OracleServiceORCL
oracle.exe 3768 OracleServiceTestDB
oracle.exe 872 OracleServiceTestDB2

------------------
Actifio Mounts
------------------
Actifio-Backup-ORCL D:\mount_1
Actifio-Backup-ORCL Y:
```
Recovering Oracle Databases in a Windows Environment Manually
Using RMAN to a Scheduled Backup Point if the archivelog is Not Protected through Actifio

To recover an entire out-of-band Oracle database in a Windows environment:

1. Mount the database backup snapshot from Actifio back to the Oracle server as detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.

2. Set the database environment and start the database in no-mount state using the parameter file from the Actifio mounted volume (for example for a mounted database volume to E:\):
   
   sqlplus / as sysdba
   sql> startup nomount pfile='E:\<sid>\_backup.ora';

3. Create spfile from pfile:
   
   sql> create spfile='%ORACLE_HOME%/database\spfile<sid>.ora' from pfile='E:\<sid>\_backup.ora';

4. Start the database with spfile in the nomount state:
   
   sql> shutdown immediate;
   sql> startup nomount;

5. Restore the control file using RMAN from the Actifio mounted volume:
   
   rman target /
   rman> restore controlfile from 'E:\cf-D_<sid>-id_<id>.ctl' ;

6. Mount the database:
   
   rman> alter database mount;

7. Catalog the datafile and the archive file folder from the Actifio mounted volume to RMAN:
   
   rman> run
   {  
   catalog start with 'E:\datafile' noprompt;
   catalog start with 'E:\archivelog' noprompt;
   }

8. Restore and recover the database:
   
   rman> run
   {  
   restore database;
   recover database;
   }

9. Roll forward the logs from the Actifio Desktop as detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.

10. Open the database with reset log option:
    
    rman> alter database open resetlogs;
Recovering Oracle Databases in a Windows Environment Manually Using RMAN to a Scheduled Backup Point with Roll-Forward of Actifio-Protected archivelog

1. Mount the image from the source database server to recover. Mount the backup snapshot from Actifio back to the Oracle server as detailed in Chapter 8, Accessing, Recovering, or Restoring an Oracle Database via the Actifio Desktop.

2. Set the database environment and start the database in no-mount state using the parameter file from the Actifio mounted volume. In this example, the database backup image will be mounted at: E:\ and the protected archive log will be mounted at: Z:\.
   
   sqlplus / as sysdba
   sql> startup nomount pfile='E:\<sid>___backup.ora';

3. Create spfile from pfile:
   
   sql> create spfile='%ORACLE_HOME%/database/spfile<sid>.ora' from pfile='E:\<sid>___backup.ora';

4. Start the database with spfile in the nomount state:
   
   sql> shutdown immediate;
   sql> startup nomount;

5. Restore the control file using RMAN from the Actifio mounted archive log image.
   
   rman target /
   rman> restore controlfile from 'Z:\cf-D_<sid>-id_<id>.ctl' ;

6. Mount the database:
   
   rman> alter database mount;

7. Catalog the datafile and archivelog folder from Actifio mounted database image and archive log image to RMAN
   
   rman> run
   { catalog start with 'E:\datafile' noprompt;
   catalog start with 'E:\archivelog' noprompt;
   catalog start with 'Z:\archivelog' noprompt;
   }

8. Restore and recover the database:
   
   rman> run
   { restore database;
   recover database;
   }

   For a specific point in time recovery run the recover command as below:
   
   rman> run
   { restore database;
   recover database until time "to_date('<desired time stamp>','yyyymmddhh24mi')";
   }

9. Open the database with reset log option:
   
   rman> alter database open resetlogs;

   The database is available for read and write.
15 Configurations for using Actifio in an Exadata Environment

Actifio CDS and Sky support capture and presentation of Exadata data on Oracle Linux-based database servers with a supported RHEL kernel.

- The Actifio appliance is connected over iSCSI in the network (not in data path). It may be necessary to install the iSCSI RPMs on each Exadata node. Doing so is non-disruptive and fully supported by Oracle.
- RMAN backup uses RMAN to directly write to copy data store presented by Actifio as a file system or as an ASM Disk Group.
- Actifio incremental-forever backup uses RMAN Incrementally Updated Backups, rolling forward image copy backups.

Actifio Capture of Exadata Data

- Data Capture Formats: Under ASM Disk Group or Under File System
- Backup is fully supported by Oracle for Exadata with HCC or Non-HCC data over ISCSI to Actifio CDS or Sky

*Note:* HCC Data cannot be deduplicated.

Presentation of Actifio Managed Exadata Data

Traditional recovery of database using RMAN is fully supported by Oracle for Exadata with HCC or Non-HCC data. Application Aware mounts are also possible:

**Application Aware Mount**

<table>
<thead>
<tr>
<th>Mounting Data from</th>
<th>HCC Data</th>
<th>Non-HCC Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exadata to Exadata</td>
<td>Application Aware mount will be successful but the virtual copy cannot be used until the HCC data is uncompressed. This can be achieved using a post script during the Application Aware mount. This requires proper configuration of the staging disk size during protection setup to accommodate the uncompress of the HCC data during the Application Aware mount.</td>
<td>Fully supported</td>
</tr>
<tr>
<td>Exadata to non-Exadata</td>
<td></td>
<td>Fully supported</td>
</tr>
</tbody>
</table>

*Note:* Query offload and Smart Scan of Exadata feature will not available for Virtual copy.
There are four steps to protecting SAP ECC/BW:

1. **Protecting the Oracle Database** on page 113
2. **Refreshing the Database** on page 113
3. **After the Refresh, on the Target Oracle Database** on page 113
4. **After the Refresh, on the Target SAP Application Server** on page 114

### Protecting the Oracle Database

To protect the Oracle database, see Chapter 7, *Virtualizing an Oracle Database for Data Protection and Agility*.

### Refreshing the Database

Use an application aware mount to refresh the target test/dev database:

1. On the target SAP database server and application server, stop the SAP application and database.
2. Follow the pre-refresh and post-refresh activity for system copy in the SAP system copy guide: 1738258 - *System Copy of Systems Based on SAP NetWeaver*. https://websmp104.sap-ag.de/public/instguides
3. Use an Actifio application aware mount to refresh the target Oracle database as detailed in *Mounting an Oracle Database as a Virtual Application* on page 48.

### After the Refresh, on the Target Oracle Database

On Target SAP Database server:

1. Check the OPS$<OS_USER> in the database: (always enter <os_user> in uppercase)
   
   ```sql
   SELECT * FROM DBA_USERS WHERE USERNAME = 'OPS$<os_user>';
   ```

2. If the system does not return an entry, create the user:
   
   ```sql
   CREATE USER "OPS$<os_user>" DEFAULT TABLESPACE <user_tsp>
   TEMPORARY TABLESPACE PSAPTEMP IDENTIFIED EXTERNALLY;
   ```

3. Ensure that the name of the OPS$ user is specified entirely in uppercase

4. The table SAPUSER must occur in the system only once and it must be assigned to the user OPS$<sid>ADM. Use the following query to check this:

   ```sql
   SELECT OWNER FROM DBA_TABLES WHERE TABLE_NAME = 'SAPUSER';
   ```

   If the system returns an owner <owner> other than OPS$<sid>ADM, delete the relevant SAPUSER tables:
DROP TABLE "<owner>".SAPUSER;
If the system does not return OPS$<sid>ADM, then create the table SAPUSER as <sid>adm and enter the password:

CREATE TABLE "OPS$<sid>ADM".SAPUSER
(USERID VARCHAR2(256), PASSWD VARCHAR2(256));

INSERT INTO "OPS$<sid>ADM".SAPUSER VALUES ('<sapowner>', '<password>');

After the Refresh, on the Target SAP Application Server

1. Modify the profiles for dbs_ora_schema to the right schema name
2. Run R3trans -d on the application server and make sure the return code is 000
3. Import the license key:

   saplikey pf=/usr/sap/<SID>/SYS/profile/<instance_profile> -install /<directory>/license.txt

   The license.txt file can be generated from the SAP site for the application server. This is specific for the hardware key that identifies the application server from SAP point of view.
17 Oracle RMAN Logs

This chapter details:

Oracle Protection Logs on Linux/Unix on page 115
Oracle Protection Logs on Windows on page 116

Oracle Protection Logs on Linux/Unix

These are the logs that you might need to consult:

Oracle Protection Logs: Standard Mounts

<table>
<thead>
<tr>
<th>Log</th>
<th>Location</th>
<th>What’s In It</th>
<th>What to Look For</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connector log</td>
<td>/var/act/log/UDSAgent.log</td>
<td>For any mount job.</td>
<td>Any error with ORA-</td>

<td>Steps to configure target database post-roll-forward.</td>
<td>Any error with ORA-</td>
</tr>
</tbody>
</table>

DBAs and developers can use actDBM.pl to perform database access tasks using the command line interface. ActDBM is a set of Perl scripts that let you automate all essential tasks with a simple language that needs no SSH keys, doesn’t store passwords in the clear and takes almost no effort to learn. ActDBM.pl is installed on the database server automatically along with the Actifio Connector.

This section includes:

- Installing and Configuring actDBM.pl on page 118
- ActDBM Commands on page 120
  - listImageDetails
  - listApplication
  - listDiscoveredHost
  - backup
  - restore
  - clone (both Create a New Clone under Oracle ASM and Refresh a Clone)
  - mount
  - cleanup (Unmount and Delete an Image)
  - runwf (both Direct Mount Workflow and LiveClone Workflow)
  - createliveclone
  - refreshliveclone
  - restoreASMswitch (Instant Oracle Database Recovery)
  - restoreASMrebalance
- actDBM.pl Script Template on page 139
- Perl Examples of actDBM Usage and Results on page 143
- RESTful API Examples of actDBM Usage and Results on page 144

**Note:** ActDBM can be used with both Actifio Sky and Actifio CDS appliances.
Installing and Configuring actDBM.pl

There are four steps to installing and configuring actDBM.pl:

- Installing actDBM.pl with the Actifio Connector on page 118
- Installing and Verifying the Five Required Perl Modules on page 118
- Enabling and Verifying Port 443 on page 118
- Storing the Login Credentials for an Actifio Appliance (CDSconfig) on page 119

Installing actDBM.pl with the Actifio Connector

The actDBM script library is automatically installed on the Oracle host when you install the Actifio Connector. It is available on the host under /act/act_scripts/actdbm. To install the Actifio Connector, see Connecting Hosts to Actifio Appliances in your Actifio Documentation Library.

The main script is a Perl script named actDBM.pl. You can see examples of actDBM usage and output in RESTful API Examples of actDBM Usage and Results on page 144. If you want to create your own shell scripts to create a workflow to run backup, refresh clone, and other operations, follow the script template at actDBM.pl Script Template on page 139.

Installing and Verifying the Five Required Perl Modules

These five Perl modules must be installed on the server where the actDBM tool is deployed and configured. Follow the verify step first to see if each module is already installed. If it is not, then install it:

### Installing the Five Required Perl Modules on an AIX System

<table>
<thead>
<tr>
<th>PERL Module</th>
<th>Verify</th>
<th>Install on Red Hat or CentOS Linux</th>
<th>Install on SUSE or OpenSUSE Linux</th>
<th>Install on AIX</th>
</tr>
</thead>
<tbody>
<tr>
<td>JSON</td>
<td>perl -e &quot;use JSON&quot;</td>
<td>yum install perl-JSON</td>
<td>zypper install perl-JSON</td>
<td>cpan&gt; install JSON</td>
</tr>
<tr>
<td>LWP::UserAgent</td>
<td>perl -e &quot;use LWP::UserAgent&quot;</td>
<td>yum install perl-LWP::UserAgent</td>
<td>zypper install perl-LWP::UserAgent</td>
<td>cpan&gt; install LWP::UserAgent</td>
</tr>
<tr>
<td>IO::Socket::SSL</td>
<td>perl -e &quot;use IO::Socket::SSL&quot;</td>
<td>yum install perl-IO-Socket-SSL</td>
<td>zypper install perl-IO-Socket-SSL</td>
<td>cpan&gt; install IO::Socket::SSL</td>
</tr>
<tr>
<td>Net::SSLeay</td>
<td>perl -e &quot;use Net::SSLeay&quot;</td>
<td>yum install perl-Net-SSLeay</td>
<td>zypper install perl-Net-SSLeay</td>
<td>cpan&gt; install Net::SSLeay</td>
</tr>
<tr>
<td>LWP::Protocol::https</td>
<td>perl -e &quot;use LWP::Protocol::https&quot;</td>
<td>yum install perl-LWP::Protocol-https</td>
<td>zypper install perl-LWP::Protocol-https</td>
<td>cpan&gt; install LWP::Protocol::https</td>
</tr>
</tbody>
</table>

Enabling and Verifying Port 443

ActDBM uses https port 443 for communication between the host and the appliance. Port 443 should be enabled for the host where the actDBM tool is configured. To test whether the port 443 is enabled, run telnet from the actDBM configured host:

```bash
telnet <Appliance IP address> 443
```

If port 443 is enabled then the sample output looks like this:

```
[root@zoravmn4 ~]# telnet <Actifio CDS IP> 443
```
Storing the Login Credentials for an Actifio Appliance (CDSconfig)

This is one time setup to create and store the Actifio username and password (encrypted). This configuration file is used to access the Actifio CDS or Sky appliance for invoking different operations using the API.

```
perl actDBM.pl --type cdsconfig
  --username <username>
  --password <password>
  --CDS <appliance ip>
```

Repeat as needed for each affected Actifio appliance. After storing the appliance details, you can run actDBM.pl from the Oracle host to the configured Actifio appliance.

Running actDBM.pl

To run the actDBM tool, CD to /act/act_scripts/actdbm folder and invoke .actDBM.pl.

To run the script from any other directory, include the script directory in the Perl library path by using the -I switch in the command line argument:

```
perl -I /act/act_scripts/actdbm/ /act/act_scripts/actdbm/actDBM.pl
```

Usage of actdbm.pl

When you run actDBM.pl, you must use the --type parameter and a type option such as backup:

```
actdbm.pl -type backup
```

The type options for actDBM.pl are:

```
Usage: actDBM
  --type
    <backup>
    <restore>
    <clone>
    <mount>
    <cleanup>
    <listImageDetails>
    <runwf>
    <createliveclone>
    <refreshliveclone>
    <restoreASMswitch>
    <restoreASMrebalance>
    <cdsconfig>
```
**ActDBM Commands**

ActDBM.pl permits these operations:

<table>
<thead>
<tr>
<th>To</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return a list of snapshot images with recovery range for the</td>
<td>listImageDetails on page 121</td>
</tr>
<tr>
<td>protected database application</td>
<td></td>
</tr>
<tr>
<td>Return a list of applications on a host</td>
<td>listApplication on page 122</td>
</tr>
<tr>
<td>Return a list of hosts known to an Actifio appliance</td>
<td>listDiscoveredHost on page 123</td>
</tr>
<tr>
<td>Back up a protected (source) database using traditional RMAN</td>
<td>backup on page 124</td>
</tr>
<tr>
<td>option</td>
<td></td>
</tr>
<tr>
<td>Restore and recover the protected (source) database using</td>
<td>restore on page 125</td>
</tr>
<tr>
<td>traditional RMAN option</td>
<td></td>
</tr>
<tr>
<td>Create or Refresh a copy of database with an Application Aware</td>
<td>clone on page 126</td>
</tr>
<tr>
<td>mount provisioning option depending on optype</td>
<td></td>
</tr>
<tr>
<td>Mount the backup image to specified target server</td>
<td>mount on page 131</td>
</tr>
<tr>
<td>Stop and remove a copy of a database running out of a mounted</td>
<td>cleanup (Unmount and Delete an Image)</td>
</tr>
<tr>
<td>image and remove the file system mount or drop an ASM disk group</td>
<td>on page 132</td>
</tr>
<tr>
<td>as part of cleanup</td>
<td></td>
</tr>
<tr>
<td>Run the pre-created DirectMountWorkflow or LiveCloneWorkflow</td>
<td>runwf on page 133</td>
</tr>
<tr>
<td>based on --subtype option of runwf</td>
<td></td>
</tr>
<tr>
<td>Create a new LiveClone using the source image</td>
<td>createliveclone on page 135</td>
</tr>
<tr>
<td>Refresh an existing LiveClone using the source image</td>
<td>refreshliveclone on page 136</td>
</tr>
<tr>
<td>Instantly switch and start the database to Actifio mounted ASM</td>
<td>restoreASMswitch (Instant Oracle</td>
</tr>
<tr>
<td>Disk Group. The database will be up and running in its original</td>
<td>Database Recovery) on page 137</td>
</tr>
<tr>
<td>configuration on your Actifio storage</td>
<td></td>
</tr>
<tr>
<td>Migrate the database back to production storage or to new storage</td>
<td>restoreASMrebalance on page 138</td>
</tr>
<tr>
<td>for a switched database running out of Actifio image</td>
<td></td>
</tr>
</tbody>
</table>
listImageDetails
To return a list of snapshot images with recovery range for a protected database, use `--type listImageDetails`

Example

```perl
perl actDBM.pl --type listImageDetails
   --dbname <database name>
   [--hostname <hostname>]
   [--CDS <appliance name|IP>]
   [--wait <yes|no>]
   --remoteApp <no|yes>
```

**listImageDetails Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Name of database. This is a required parameter. The default value is localHostname.</td>
</tr>
<tr>
<td>--hostname</td>
<td>Name of source host. If not specified, host where script runs is used.</td>
</tr>
<tr>
<td>--CDS</td>
<td>The name or IP address of the Actifio Sky or CDS appliance</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job has completed. The default value is “no”.</td>
</tr>
<tr>
<td>--remoteApp</td>
<td>This is a flag to indicate whether the application data is to be retrieved from a local appliance or from a remote appliance. The values are no and yes. The default value is “no”.</td>
</tr>
</tbody>
</table>

For a RESTful example of this command and sample output, see [Listing Images Without Archive Logs](#) and [Listing Images With Archive Logs Collected Between Oracle RMAN L1 Incremental Snapshots](#) on page 144.
**listApplication**

To return a list of applications on a host, use `--type listApplication`

**Example**

```perl
perl actDBM.pl --type <listApplication>  
--hostname <hostname>  
[--apptype <application type Oracle/SqlServerWriter>]  
[--protection <protectionState all/protected/disabled/notProtected>]  
--CDS <CDS name|ip>  
[--wait <yes|no>]
```

**listApplication Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--hostname</td>
<td>Name of the source host. If not specified, host where script runs is used.</td>
</tr>
<tr>
<td>--apptype</td>
<td>Either Oracle or SqlServerWriter</td>
</tr>
<tr>
<td>--protection</td>
<td>One of four protection states: all, protected, disabled, or notProtected</td>
</tr>
<tr>
<td>--CDS</td>
<td>The name or IP address of the Actifio Sky or CDS appliance</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job has completed. The default value is “no.”</td>
</tr>
</tbody>
</table>

For a Perl example of this command and sample output, see [Listing Applications Discovered on an Actifio Appliance](#) on page 143.
listDiscoveredHost

To return a list of discovered hosts known to a specific Actifio appliance, use `--type listDiscoveredHost`

**Example**

```perl
perl actDBM.pl --type <listDiscoveredHost>
--CDS <CDS name|ip>
[--wait <yes|no>]
```

**listDiscoveredHost Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--CDS</td>
<td>The name or IP address of the Actifio Sky or CDS appliance</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job has completed. The default value is “no.”</td>
</tr>
</tbody>
</table>

For a Perl example of this command and sample output, see Listing Hosts Connected to an Actifio Appliance on page 143.
backup
To create a database backup, use --type backup, backuptype <db|log|dblog>. Use this for:

- db backup
- log backup
- dblog backup

Example
perl actDBM.pl --type backup
--dbname <database name>
[--hostname <hostname>]
[--backuptype <db|log|dblog>]
[--CDS <appliance name|ip>]
[--backuplabel <backup bookmark label name>]
[--wait <yes|no>]

backup Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Name of database. This is a required parameter. The default value is localHostname.</td>
</tr>
<tr>
<td>--hostname (optional)</td>
<td>Name of database host. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td>--backuptype</td>
<td>Type of backup operation. This is an optional parameter. If not specified, the default type is database backup (db).</td>
</tr>
<tr>
<td>--backuplabel</td>
<td>Optional parameter. Use this to mark a backup image during backup.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job is completed. The default value is No.</td>
</tr>
</tbody>
</table>

For a RESTful example of this command and sample output, see Running an On-Demand Backup on page 145.
To restore a database, use `--type restore`

**Example**

```perl
perl actDBM.pl --type restore
   --dbname <source database name>
   --OSusername <OS oracle owner>
   [--OSpassword <OS oracle owner password>]
   [--image <Image name>]
   [--backuplabel <backup label ID>]
   [--sourceHost <source hostname>]
   [--pointInTime <Recovery time 'yyyy-mm-dd hh24:mi:ss'>]
   [--CDS <appliance ip|name>]
   [--wait <yes|no>]
   [--openDB <true|false>]
```

**restore Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Source database name</td>
</tr>
<tr>
<td>--OSusername</td>
<td>OS Oracle owner</td>
</tr>
<tr>
<td>--OSpassword</td>
<td>OS Oracle owner password. Optional, for backward compatibility with 6.2.x</td>
</tr>
<tr>
<td>--image</td>
<td>Image name. Optional. If not provided will use backuplabel to get the image for recovery. If both are not provided then the latest image will be used.</td>
</tr>
<tr>
<td>--backuplabel</td>
<td>Backup label ID. Optional. If image name is not provided will use backuplabel to get the image for recovery. If both are not provided then the latest image will be used.</td>
</tr>
<tr>
<td>--sourceHost</td>
<td>Source hostname</td>
</tr>
<tr>
<td>--pointInTime</td>
<td>Recovery time in the format yyyy-mm-dd hh24:mi:ss. Default: It will recover to all available archive logs.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP or name</td>
</tr>
<tr>
<td>--wait</td>
<td>Yes or No. The default value is “no”.</td>
</tr>
<tr>
<td>--openDB</td>
<td>True or False. Default: True (recover and open the database at the end of this operation.)</td>
</tr>
</tbody>
</table>
clone
This creates or refreshes a copy of the database with an Application Aware mount provisioning option depending on which option you select:

newclone creates a new copy of the database to the specified target server. Set optype to newclone to create a new copy of the database to the specified target server. This will error out if the same copy of database already exists on specified target. For details, see Create a New Clone under Oracle ASM or Create a New Clone under File System.

refresh refreshes the existing clone copy of database created using New Clone option. Set optype to refresh to refresh the existing clone copy of a database created using the newclone option. This will error out if there is no copy of database to refresh on target. For details, see Refresh a Clone on page 130.

actDBM.pl --type clone
[--optype <newclone|refresh>]

Create a New Clone under Oracle ASM
To create a new clone under Oracle ASM, use --type clone, optype <newclone>

Example
perl actDBM.pl --type clone --optype newclone
[--optype <newclone>]
--dbname <source database name>
--TargetDBName <app-aware mount database name>
--OSusername <OS oracle owner>
[--image <Image name>]
[--sourceHost <source hostname>]
[--targetHost <target hostname>]
[--TargetOracleHome <Target Oracle Home>]
[--listenerpath <Target Oracle Listener path>]
[--pointInTime <Recovery time 'yyyy-mm-dd hh24:mi:ss'>]
[--ASMdiskgroup <ASM diskgroupname>]
[--RACNodeList <list of RAC nodes separated by colon>]
[--protectNewApplication <yes|no>]
[--totalmemory <Database memory size in MB>]
[--SGApct <SGA %>]
[--DBcacheSize <DB Cache Size in MB>]
[--SharedPoolSize <Shared Pool Size in MB>]
[--DRecoveryFileDestSize <DB Recovery File Dest Size in MB>]
[--Processes <Max Number of Processes>]
[--OpenCursors <Max Number of Cursors>]
[--DiagnosticDestination <Diagnostic Destination>]
[--DBCSet <Database Character Set>]
[--tnsip <TNS Listener IP/scan IP>]
[--tnsport <TNS listener port>]
[--tnsdomain <TNS Domain>]
[--redosize <redo size in MB>]
[--recovery <yes|no>]
[--envvar <post script env:post script db type>]
[--backuplabel <backup label ID>]
[--standalone <yes|no>]
[--template <child db protect template name>]
[--profile <child db protect profile name>]
[--CDS <CDS ip|name>]
[--remoteApp <no|yes>]
[--wait <yes|no>]
Create a New Clone under File System

To create a new clone under a file system, use --type clone, optype <newclone>

Example

perl actDBM.pl --type clone --optype newclone
  [--optype <newclone>]
  --dbname <source database name>
  --TargetDBname <app-aware mount database name>
  --OSusername <OS oracle owner>
  [--image <Image name>]
  --sourceHost <source hostname>
  --TargetOracleHome <Target Oracle Home>
  --listenerpath <Target Oracle Listener path>
  --pointInTime <Recovery time 'yyyy-mm-dd hh24:mi:ss'>
  --mountpoint <filesystem mountpoint '/act/mnt'>
  --protectNewApplication <yes|no>
  [--totalmemory <Database memory size in MB>]
  [--SGApct <SGA %>]
  [--DBcacheSize <DB Cache Size in MB>]
  [--SharedPoolSize <Shared Pool Size in MB>]
  [--DBrecoveryFileDestSize <DB Recovery File Dest size in MB>]
  [--Processes <Max Number of Processes>]
  [--OpenCursors <Max Number of Cursors>]
  [--DiagnosticDestination <Diagnostic Destination>]
  [--DBCharacterSet <Database Character Set>]
  [--tnsip <TNS Listener IP/scan IP>]
  [--tnsport <TNS listener port>]
  [--tnsdomain <TNS Domain>]
  [--redosize <redo size in MB>]
  [--recovery <yes|no>]
  [--envvar <post script env:post script db type>]
  [--backuplabel <backup label ID>]
  [--standalone <yes|no>]
  [--template <child db protect template name>]
  [--profile <child db protect profile name>]
  [--CDS <CDS ip|name>]
  [--remoteApp <no|yes>
  [--wait <yes|no>]

clone Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--optype</td>
<td>Type of clone operation. This is optional parameter. If not specified, then a newclone operation will be performed.</td>
</tr>
<tr>
<td>--dbname</td>
<td>Name of database. This is a required parameter. The default value is localHostname.</td>
</tr>
<tr>
<td>--TargetDBname</td>
<td>Application aware mount clone database name.</td>
</tr>
<tr>
<td>--OSusername</td>
<td>OS Oracle owner name</td>
</tr>
</tbody>
</table>
## clone Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--image</td>
<td>Image name to use for the database to be cloned. This is an optional parameter. If not provided, backuplabel will be used to get the image for recovery. If both are not provided then the latest image will be used.</td>
</tr>
<tr>
<td>--sourceHost</td>
<td>Name of source host. This is an optional parameter. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td>--targetHost</td>
<td>Name of target host. This is an optional parameter. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td>--TargetOracleHome</td>
<td>Oracle Home on target database Host</td>
</tr>
<tr>
<td>--listenerpath</td>
<td>Oracle listener path on target database host.</td>
</tr>
<tr>
<td>--pointInTime</td>
<td>Date and Time for clone the database. This is an optional parameter. If not specified, the database will be cloned with all available backup archive logs.</td>
</tr>
<tr>
<td>--mountpoint</td>
<td>Mountpoint name for filesystem application aware mountpoint name. This is not applicable for ASM application aware mount. Optional.</td>
</tr>
<tr>
<td>--protectNewApplication</td>
<td>Flag to indicate the new clone database is to be protected or not. The default value is No.</td>
</tr>
<tr>
<td>--ASMdiskgroup</td>
<td>Name of the mount ASM disk group name for clone</td>
</tr>
<tr>
<td>--RACNodeList</td>
<td>List of RAC node IP addresses separated by colon. This is a required parameter.</td>
</tr>
<tr>
<td>--totalmemory</td>
<td>The default value is the same as the memory on the source.</td>
</tr>
<tr>
<td>--SGApct</td>
<td>Percentage of Oracle System Global Area memory component. Optional.</td>
</tr>
<tr>
<td>--DBcacheSize</td>
<td>Oracle db_cache_size memory component in MB. Optional.</td>
</tr>
<tr>
<td>--SharedPoolSize</td>
<td>Oracle shared_pool_size memory parameter in MB. Optional.</td>
</tr>
<tr>
<td>--DBrecoveryFileDestSize</td>
<td>Oracle db_recovery_file_dest_size parameter value in MB. The default value is 51200MB (50 GB). Optional.</td>
</tr>
<tr>
<td>--Processes</td>
<td>Oracle processes parameter value. The default value is 500. Optional.</td>
</tr>
<tr>
<td>--OpenCursors</td>
<td>Oracle open_cursors init parameter value. If not specified, the value from the source database value will be used. Optional.</td>
</tr>
<tr>
<td>--DiagnosticDestination</td>
<td>Oracle diagnostic_dest parameter value. If not specified, Oracle will allocate automatically. Optional.</td>
</tr>
</tbody>
</table>
### clone Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--DBCharacterSet</td>
<td>Oracle database characterset parameter value.</td>
</tr>
<tr>
<td>--tnsip</td>
<td>TNS ip/scan/name for the target database. Default is target host IP address.</td>
</tr>
<tr>
<td>--tnsport</td>
<td>TNS port number for the target database. Default is 1521.</td>
</tr>
<tr>
<td>--tnsdomain</td>
<td>TNS domain name if any for the target database. Optional. By default, no domain name is used in creating service name entry under tnsnames.ora</td>
</tr>
<tr>
<td>--redosize</td>
<td>Oracle Redo log file size value. The default value is 1000 MB if not specified. Optional.</td>
</tr>
<tr>
<td>--recovery</td>
<td>Flag to open the database or leave it in a mounted state. Default is yes.</td>
</tr>
<tr>
<td>--envvar</td>
<td>Optional. Environment variables as arguments for running post script.</td>
</tr>
<tr>
<td>--backuplabel</td>
<td>Optional. If image name is not provided, then backuplabel is used to get the image for recovery. If both are not provided then the latest image is used.</td>
</tr>
<tr>
<td>--standalone</td>
<td>Flag to indicate if clone database is standalone or RAC (default) database.</td>
</tr>
<tr>
<td>--template</td>
<td>Child database protected template name. Required when protectNewApplication is set to yes.</td>
</tr>
<tr>
<td>--profile</td>
<td>Child database protected profile name. Required when protectNewApplication is set to yes.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job got completed. The default value is No.</td>
</tr>
<tr>
<td>--remoteApp</td>
<td>This is a flag to indicate whether the application data is to be retrieved from a local appliance or from a remote appliance. The values are no and yes. The default value is “no”.</td>
</tr>
</tbody>
</table>

For an example of this command and sample output, see Cloning an Image on page 145.
Refresh a Clone

To refresh a clone, use `--type clone, optype refresh`

Example

```perl
perl actDBM.pl --type clone --optype refresh
    --dbname <source database name>
    --TargetDBname <app-aware mount database name>
    [--image <Image name>]
    [--sourceHost <source hostname>]
    [--targetHost <target hostname>]
    [--pointInTime <Recovery time 'yyyy-mm-dd hh24:mi:ss'>]
    [--backuplabel <backup label ID>]
    [--CDS <CDS ip|name>]
    [--wait <yes|no>]
```

refresh Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--dbname</code></td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td><code>--TargetDBname</code></td>
<td>Application aware mount clone database name.</td>
</tr>
<tr>
<td><code>--image</code></td>
<td>Image name to use for refreshing the cloned database. This is an optional parameter. If not specified, the latest image will be used for refreshing the cloned database.</td>
</tr>
<tr>
<td><code>--sourceHost</code></td>
<td>Name of source host. This is an optional parameter. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td><code>--targetHost</code></td>
<td>Name of target host. This is an optional parameter. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td><code>--pointInTime</code></td>
<td>Date and Time to refresh the cloned database. This is an optional parameter. If not specified, the cloned database will be refreshed with all the available archive logs.</td>
</tr>
<tr>
<td><code>--backuplabel</code></td>
<td>Optional. If image name is not provided, then backuplabel is used to get the image for recovery. If both are not provided then the latest image is used.</td>
</tr>
<tr>
<td><code>--CDS</code></td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td><code>--wait</code></td>
<td>Wait flag to wait until the job has completed. The default value is “no”.</td>
</tr>
</tbody>
</table>
mount

To mount a backup image, use `--type mount`

Example

```perl
perl actDBM.pl --type mount
--dbname <Database name>
[--image <Image name>]
[--sourceHost <Source host name>]
[--targetHost <Target host name>]
[--ASMdiskgroup <ASM diskgroup name>]
[--mountpoint <filesystem mountpoint '/act/mnt'>]
[--RACNodeList <RAC node list>]
[--CDS <appliance name|ip>]
[--wait <yes|no>]
```

### mount Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--dbname</code></td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td><code>--sourceHost</code></td>
<td>Name of source host. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td><code>--targetHost</code></td>
<td>Name of target host. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td><code>--image</code></td>
<td>Image name to use for mount the database. If not specified, the latest image will be used for database mount.</td>
</tr>
<tr>
<td><code>--ASMdiskgroup</code></td>
<td>This parameter is for databases protected under ASM Disk Group only to provide a preferred Disk Group Name to mount a backup image under ASM.</td>
</tr>
<tr>
<td><code>--RACNodeList</code></td>
<td>This parameter is for databases protected under ASM Disk Group only to provide a list of node IP address separated by colon for RAC member nodes to mount a backup image under ASM to be available to the RAC members nodes listed here. This is a required parameter, even for mounting to a single node. The first IP address in RAC Node list must be the selected host’s IP address.</td>
</tr>
<tr>
<td><code>--mountpoint</code></td>
<td>This is required for snapshot image backed up on filesystem. This parameter is for databases protected under File System only to provide a mount point to mount a backup image under provided file system mount point.</td>
</tr>
<tr>
<td><code>--CDS</code></td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td><code>--wait</code></td>
<td>Wait flag to wait until the job has completed. The default value is “no”</td>
</tr>
</tbody>
</table>
cleanup (Unmount and Delete an Image)

To perform an unmount and delete operation on an image, use `--type cleanup`

This operation will stop and remove any copy of a database running out of a mounted image and remove the file system mount, or drop any ASM disk group as part of cleanup.

**Example**

```
perl actDBM.pl --type cleanup
    --dbname <database name>
    --clonedbname <target database name>
    [--sourceHost <source host name>]
    [--targetHost <target host name>]
    [--CDS <CDS name|ip>]
    [--wait <yes|no>]
```

**cleanup Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Name of source database for cleanup. This is a required parameter.</td>
</tr>
<tr>
<td>--clonedbname</td>
<td>Cloned database name or application aware mount database name which is created using Actifio.</td>
</tr>
<tr>
<td>--sourceHost</td>
<td>Optional. Name of source host. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td>--targetHost</td>
<td>Optional. Name of target host. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job got completed. The default value is “no”</td>
</tr>
</tbody>
</table>
runwf

There are two types of workflows:

Direct Mount Workflow on page 133

LiveClone Workflow on page 134

Run Workflow runs the pre-created DirectMountWorkflow or LiveCloneWorkflow based on --subtype option, either directmount or liveclone. For an example of this command and sample output, see Running an Oracle Workflow on page 145.

Direct Mount Workflow

DirectMountWorkflow creates a new database copy or refreshes an existing database copy based on the re-provision option. To run a direct mount workflow, use --type runwf, subtype directmount

Example

perl actDBM.pl --type runwf
--subtype directmount
--dbname <source database name>
--hostname <sourcehostname>
--wfname <workflow name>
--reprovision <yes|no>
[--image <image name>]  
[--CDS <appliance name|ip>]
[--wait <yes|no>]

directmount Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--subtype</td>
<td>Type of workflow to be run, either directmount or liveclone.</td>
</tr>
<tr>
<td>--dbname</td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td>--hostname</td>
<td>Name of source host. If not specified, host where script runs is used.</td>
</tr>
<tr>
<td>--wfname</td>
<td>Name of direct mount workflow</td>
</tr>
<tr>
<td>--reprovision</td>
<td>Reprovision flag to indicate new application aware mount or reprovision application aware mount.</td>
</tr>
<tr>
<td>--image</td>
<td>Image name to use for clone the database. This is an optional parameter. If not specified, the latest image will be used for database clone.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job got completed. The default value is “no.”</td>
</tr>
</tbody>
</table>
**LiveClone Workflow**

LiveClone Workflow first creates a new LiveClone or refreshes an existing LiveClone based on refreshliveclone or provisionliveclone option, and then creates or refreshes the target database copy based on the reprovision flag using the LiveClone image. To run a LiveClone workflow, use `--type runwf, subtype liveclone`

**Example**

```perl
perl actDBM.pl --type runwf
  --subtype liveclone
  --dbname <source database name>
  --hostname <sourcehostname>
  --wfname <workflow name>
  --reprovision <yes|no>
  [--image <Image name>]
  [--refreshliveclone <yes|no>]
  [--provisionliveclone <yes|no>]
  [--CDS <appliance name|ip>]
  [--wait <yes|no>]
```

**liveclone Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--subtype</td>
<td>Type of workflow to be run, either “directmount” or “liveclone”</td>
</tr>
<tr>
<td>--dbname</td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td>--hostname</td>
<td>Name of source host. If not specified, host where script runs is used. Optional</td>
</tr>
<tr>
<td>--wfname</td>
<td>Name of LiveClone workflow</td>
</tr>
<tr>
<td>--refreshliveclone</td>
<td>Refresh the LiveClone image for this workflow. The default is yes.</td>
</tr>
<tr>
<td>--provisionliveclone</td>
<td>Refresh the target copy of the database. The default is yes.</td>
</tr>
<tr>
<td></td>
<td>If refreshliveclone is YES and provisionliveclone is YES, then running the workflow will first refresh the LiveClone image and then refresh the target copy of database using the refreshed image of the LiveClone.</td>
</tr>
<tr>
<td></td>
<td>If refreshliveclone is YES and provisionliveclone is NO, then running the workflow will refresh only the LiveClone image.</td>
</tr>
<tr>
<td></td>
<td>If refreshliveclone is NO and provisionliveclone is YES, then running the workflow will refresh only the target copy of database using the existing LiveClone image.</td>
</tr>
<tr>
<td>--reprovision</td>
<td>Flag to indicate a new clone or to provision already existing clone database. This MUST be set to NO the first time to create a copy of a database on the target. After the first time, set this to YES to refresh the copy of the database on the target.</td>
</tr>
<tr>
<td>--image</td>
<td>Image name to be used for LiveClone workflow. If not specified, then latest image will be used for LiveClone.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job has completed. The default value is “no”.</td>
</tr>
</tbody>
</table>
**createliveclone**

To create a new LiveClone from a source image, use `--type createliveclone`

**Example**

```perl
perl actDBM.pl --type createliveclone
--dbname <database name>
--label <liveclone label>
--diskpool <disk pool name>
[--hostname <hostname>]
[--sourceimage <source image name>]
[--backuplabel <source backup image label>]
[--CDS <appliance name|ip>]
[--wait <yes|no>]
```

**createliveclone Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td>--hostname (optional)</td>
<td>Name of source host. If not specified, host where script runs is used.</td>
</tr>
<tr>
<td>--label</td>
<td>Name of LiveClone image.</td>
</tr>
<tr>
<td>--diskpool</td>
<td>Name of disk pool for LiveClone image.</td>
</tr>
<tr>
<td>--sourceimage</td>
<td>Name of source image to create a LiveClone image.</td>
</tr>
<tr>
<td>--backuplabel</td>
<td>Name of source image label instead of image name. If neither sourceimage nor backuplabel are provided, then the latest image will be used to create the LiveClone. If both sourceimage and backuplabel are provided then sourceimage is used and backuplabel is ignored.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job has completed. The default value is “no”.</td>
</tr>
</tbody>
</table>
refreshliveclone
To refresh an existing LiveClone from the source image, use --type refreshliveclone

Example

```bash
perl actDBM.pl --type refreshliveclone
--dbname <database name>
--label <liveclone label>
[--hostname <hostname>]
[--sourceimage <source image name>]
[--backuplabel <source backup image label>]
[--targetimage <target image name>]
[--CDS <appliance name|ip>]
[--wait <yes|no>]
```

**refreshliveclone Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td>--hostname (optional)</td>
<td>Name of source host. If not specified, host where script runs is used.</td>
</tr>
<tr>
<td>--label</td>
<td>Name of LiveClone image.</td>
</tr>
<tr>
<td>--sourceimage</td>
<td>Name of source image to refresh the LiveClone.</td>
</tr>
<tr>
<td>--backuplabel</td>
<td>Name of source image label instead of image name.</td>
</tr>
<tr>
<td></td>
<td>If <em>neither</em> sourceimage nor backuplabel is provided then latest image will be used to create the liveclone.</td>
</tr>
<tr>
<td></td>
<td>If <em>both</em> sourceimage and backuplabel are provided then sourceimage is used and backuplabel is ignored.</td>
</tr>
<tr>
<td>--targetimage</td>
<td>Target Image Name to be created for LiveClone image. Optional.</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job got completed. The default value is “no”</td>
</tr>
</tbody>
</table>
**restoreASMswitch (Instant Oracle Database Recovery)**

In case of storage failure, use this command to instantly switch to an Actifio-mounted ASM Disk Group and start the database. The database will be up and running in its original configuration on your Actifio storage.

To restore an ASM database using Oracle RMAN switch, use `--type restoreASMswitch`

**Example**

```bash
perl actDBM.pl --type restoreASMswitch
--dbname <database name>
--TargetOracleHome <Target Oracle Home>
--OSusername <OS oracle username>
--OSgridusername <OS grid username>
--standalone <yes/no>
--ASMdiskgroup <ASM diskgroup name>
--RACNodeList <RAC node list>
--sourceHost <source host name>
[--image <Image name>]
[--pointInTime <Recovery time 'yyyymmddhh24mi'>]
[--mountpoint <archivelog filesystem mountpoint '/act/mnt'>]
[--CDS <appliance name|ip>]
[--wait <yes|no>]
```

**restoreASMswitch Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--dbname</td>
<td>Name of source database. This is a required parameter.</td>
</tr>
<tr>
<td>--OSusername</td>
<td>OS oracle owner name</td>
</tr>
<tr>
<td>--OSgridusername</td>
<td>OS grid owner name</td>
</tr>
<tr>
<td>--pointInTime</td>
<td>Date and Time for clone the database. This is an optional parameter. If not specified, the database will be cloned with all the available backup archive logs.</td>
</tr>
<tr>
<td>--image</td>
<td>Image name to use for clone the database. This is an optional parameter. If not specified, the latest image will be used for database clone.</td>
</tr>
<tr>
<td>--TargetOracleHome</td>
<td>Oracle Home on target database host</td>
</tr>
<tr>
<td>--ASMdiskgroup</td>
<td>Name of the mount ASM disk group name for clone</td>
</tr>
<tr>
<td>--RACNodeList</td>
<td>List of RAC node IP addresses separated by colon. This is a required parameter.</td>
</tr>
<tr>
<td>--standalone</td>
<td>Standalone flag indicator to create target database as RAC or standalone.</td>
</tr>
<tr>
<td>--sourceHost</td>
<td>Name of source host. This is required parameter.</td>
</tr>
<tr>
<td>--mountpoint</td>
<td>Archivelog filesystem mountpoint</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job got completed. The default value is “no”.</td>
</tr>
</tbody>
</table>
**restoreASMrebalance**

Use this option to migrate a database back to production storage or to new storage for a switched database running from an Actifio image.

To ASM rebalance use **--type restoreASMrebalance**

**Example**

```perl
perl actDBM.pl --type restoreASMrebalance
   --dbname <Database name running on ASM diskgroup which is to be rebalanced>
   --ASMdiskgroup <ASM diskgroup name>
   --OSgridusername <OS grid username>
   --OSusername <OS oracle username>
   --ASMdiskString <ASM disk string separated by comma>
   [--CDS <appliance name|ip>]
   [--wait <yes|no>]
```

**restoreASMrebalance Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--OSusername</td>
<td>OS Oracle owner name</td>
</tr>
<tr>
<td>--OSgridusername</td>
<td>OS grid owner name</td>
</tr>
<tr>
<td>--dbname</td>
<td>Database name running on the ASM disk group to be rebalanced</td>
</tr>
<tr>
<td>--ASMdiskgroup</td>
<td>Name of the mount ASM disk group name for clone</td>
</tr>
<tr>
<td>--ASMdiskString</td>
<td>ASM disk list of original disk group separated by comma</td>
</tr>
<tr>
<td>--CDS</td>
<td>Actifio CDS or Sky appliance IP address</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job has completed. The default value is “no”.</td>
</tr>
</tbody>
</table>

RESTful API Examples of actDBM Usage and Results

These examples use:

- production host: Oracle-Prod
- Oracle databases running on Oracle-Prod: bigdb and smalldb

Listing Images Without Archive Logs

Listing images of bigdb on Oracle-Prod:

- To reduce the length of the output, only the first three images are listed.
- The Recover Start Time (ST) and End Time (ET) are the same as we are not collecting logs for this DB.

```
[av@av-oracle actdbm]# ./actDBM.pl --type listImageDetails --CDS 172.24.1.180 --dbname bigdb --hostname Oracle-Prod
Database Name: bigdb
Host Name: Oracle-Prod
Backup Image and Recovery Range:
Snapshot Pool Images:
  Image_25785750:
  Image_25787410:
    RecoveryST: '2016-06-26 00:03:47'  RecoveryET: '2016-06-26 00:03:47'
  Image_25790014:
```

Listing Images With Archive Logs Collected Between Oracle RMAN L1 Incremental Snapshots

Listing images of smalldb on Oracle-Prod:

- To reduce the length of the output, only the first three images are listed.
- The Recovery End Time and End Sequence number is the same for each image, because we make the full log range available for every image which includes images in our deduplication pool.

```
[av@av-oracle actdbm]# ./actDBM.pl --type listImageDetails --CDS 172.24.1.180 --dbname smalldb --hostname Oracle-Prod
Database Name: smalldb

      Thread1:        StartSequence: 13230         EndSequence: 13269
De-dup Images:
  Image_25524341:
  Image_25734039:
  Image_25790261:
```
Running an On-Demand Backup

Running an on-demand snapshot:

```
[av@av-oracle actdbm]# ./actDBM.pl --type backup --dbname bigdb --hostname Oracle-Prod --CDS 172.24.1.180
policyid=8632
Job_25802477
[root@av-oracle actdbm]#
```

Cloning an Image

Cloning an image. We define a new SID for our mounted image (called billed) and a target host (demo-oracle-4). The end result is a new instance of a 2 TB Oracle database, available in less than three minutes, consuming no additional storage.

The command looks long, but most of it is just telling the Actifio Connector where to find ORACLE_HOME in case we need to use a different folder.

```
[av@av-oracle actdbm]# ./actDBM.pl --type clone --optype newclone --dbname bigdb --sourceHost Oracle-Prod --TargetDBname billed --OSusername oracle --targetHost demo-oracle-4 --TargetOracleHome /home/oracle/app/oracle/product/11.2.0/dbhome_1 --listenerpath /home/oracle/app/oracle/product/11.2.0/dbhome_1/network/admin --protectNewApplication no --recovery yes --CDS 172.24.1.180
backup array is HASH(0x27e7088)
backup name is Image_25802477
db name is bigdb
Image ID 25802479 name Image_25802477
image id is 25802479
image name is Image_25802477
Image details by name
Job_25802582 to mount Image_25802477 started
```

Now there is a new Oracle instance on target host demo-oracle-4:

```
[oracle@demo-oracle-4 ~]$ ps -ef | grep pmon
oracle  22319     1  0 21:41 ?        00:00:00 ora_pmon_billed
```

This command gives near-instant access to an off-production copy of a large production database with no need to buy or provision extra storage, engage the storage administrator, the backup administrator, or the DBA. Developers can get straight to the data.

Running an Oracle Workflow

We can re-run this command with --optype refresh to update our mounted copy.

You can embed nearly all of this in a workflow using the Actifio Desktop and just call the workflow instead:

```
[av@av-oracle actdbm]# ./actDBM.pl --type runwf --subtype directmount --dbname bigdb --hostname Oracle-Prod --wfname EverWF --CDS 172.24.1.180
backup array is HASH(0x2db3000)
backup name is Image_25802477
db name is bigdb
Image ID 25802479 name Image_25802477
image id is 25802479
image name is Image_25802477
WF Id = 25763787
mount id: 25803103
database name is clone work flow id: 25803199
```

Everything you have seen here is using RESTful API calls via a pre-built CLI. You could call these using your own scripts and integrate them into a portal.
DBAs and developers can use actAGMDBM.pl to perform database access tasks using the command line interface. ActAGMDBM is a set of Perl scripts that let you automate all essential tasks with a simple language that needs no SSH keys, doesn’t store passwords in the clear and takes almost no effort to learn. ActAGMDBM.pl is installed on the database server automatically along with the Actifio Connector.

This section includes:

- Installing and Configuring actAGMDBM.pl on page 148
- ActAGMDBM Commands on page 149
  - listAppliance
  - listImageDetails
  - backup
- ActAGMDBM.pl Script Template on page 152
- RESTful API Examples of ActAGMDBM Usage and Results on page 153

**ActAGMDBM and ActDBM**

This section is about the AGM version of ActAGMDBM. There is also an Actifio Desktop version, detailed in *Chapter 18, Oracle Database Management Using ActDBM*. The two versions are nearly identical, except for where you run them from. In addition, ActAGMDBM includes:

- an --AGM parameter used to indicate which AGM should implement the command
- a listAppliance command used to list information about the Sky and CDS appliances managed by an AGM

ActAGMDBM does not yet support all of the commands supported by ActDBM. More commands will be added with each Actifio service pack release.

**Running ActAGMDBM.pl**

To run the ActAGMDBM tool, cd to /act/act_scripts/ActAGMDBM folder and invoke ./ActAGMDBM.pl.

To run the script from another directory, include the script directory in the Perl library path. Use the -I switch in the argument: perl -I /act/act_scripts/ActAGMDBM/ /act/act_scripts/ActAGMDBM/ActAGMDBM.pl

**Usage of ActAGMDBM.pl**

When you run ActAGMDBM.pl, you must use the --type parameter and a type option such as backup:

ActAGMDBM.pl --type backup

The type options for ActAGMDBM.pl are:

[root@zoravmn1 actagm]# perl ActAGMDBM.pl
Usage:ActAGMDBM
--type
<agmconfig>
<listAppliance>
<listImageDetails>
<backup>
Installing and Configuring actAGMDBM.pl

There are two steps to installing and configuring actAGMDBM.pl:

Installing actAGMDBM.pl with the Actifio Connector on page 148
Storing the Login Credentials for an AGM (agmconfig) on page 148

Installing actAGMDBM.pl with the Actifio Connector

The ActAGMDBM script library is automatically installed on the Oracle host when you install the Actifio Connector. It is available on the host under /act/act_scripts/actagm. To install the Actifio Connector, see Connecting Hosts to Actifio Appliances in your Actifio Documentation Library.

The main script is a Perl script named ActAGMDBM.pl. You can see examples of ActAGMDBM usage and output in RESTful API Examples of ActAGMDBM Usage and Results on page 153. If you want to create your own shell scripts to create a workflow to run backup, refresh clone, and other operations, follow the script template at ActAGMDBM.pl Script Template on page 152.

Storing the Login Credentials for an AGM (agmconfig)

This is a one time setup to create and store the AGM username and password (encrypted). This configuration file is used to access the AGM for invoking different operations using the API.

```
perl ActAGMDBM.pl -type agmconfig
-username <username>
--password <password>
--AGM <AGM ip>
```

Repeat as needed for each affected AGM. After storing the appliance details, you can run ActAGMDBM.pl from the Oracle host to the configured Actifio appliance.
ActAGMDBM Commands

ActAGMDBM.pl permits these operations:

<table>
<thead>
<tr>
<th>To</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>Store the encrypted AGM credentials to permit API operations</td>
<td>Storing the Login Credentials for an AGM (agmconfig) on page 148</td>
</tr>
<tr>
<td>Return a list of applications and appliances managed by an AGM</td>
<td>listAppliance on page 149</td>
</tr>
<tr>
<td>Return a list of snapshot images with recovery range for the</td>
<td>listImageDetails on page 150</td>
</tr>
<tr>
<td>protected database application</td>
<td></td>
</tr>
<tr>
<td>Back up a protected (source) database using traditional RMAN</td>
<td>backup on page 151</td>
</tr>
<tr>
<td>option</td>
<td></td>
</tr>
</tbody>
</table>

listAppliance

To return a list of applications and appliances managed by an AGM, use --type listAppliance

Example

```
perl ActAGMDBM.pl --type <listAppliance>
     [-AGM <AGM details>]
     [-appname <appname>]
```

listAppliance Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--AGM</td>
<td>IP address of the AGM.</td>
</tr>
<tr>
<td>--appname</td>
<td>The name of the protected application</td>
</tr>
</tbody>
</table>
listImageDetails

To return a list of snapshot images with recovery range for a protected database, use `-type listImageDetails`

Example

```
perl ActAGMDBM.pl --type <listImageDetails>
    --appname <application name>
    [--hostname <hostname>]
    [--AGM <AGM ip address>]
```

### listImageDetails Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--appname</td>
<td>Name of the protected application. This is a required parameter. The default value is localHostname.</td>
</tr>
<tr>
<td>--hostname</td>
<td>Name of source host. If not specified, host where script runs is used.</td>
</tr>
<tr>
<td>--AGM</td>
<td>IP address of the AGM to execute the command.</td>
</tr>
</tbody>
</table>

For a RESTful example of this command and sample output, see listImageDetails on page 153.
backup
To create a database backup, use `--type backup, backuptype <db|log|dblog>`. Use this for:

- db backup
- log backup
- dblog backup

Example
perl actAGMDBM.pl --type backup
--appname <application name>
[--hostname <hostname>]
[--backuptype <db|log|dblog>]
[--backuplabel <backup bookmark label name>]
[--wait <yes|no>]
[--AGM <AGM ip address>]

backup Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>--appname</td>
<td>Name of the protected application. This is a required parameter. The default value is localHostname.</td>
</tr>
<tr>
<td>--hostname (optional)</td>
<td>Name of database host. If not specified, host where script is running is used.</td>
</tr>
<tr>
<td>--backuptype</td>
<td>Type of backup operation. This is an optional parameter. If not specified, the default type is database backup (db).</td>
</tr>
<tr>
<td>--backuplabel</td>
<td>Optional parameter. Use this to mark a backup image during backup.</td>
</tr>
<tr>
<td>--wait</td>
<td>Wait flag to wait until the job is completed. The default value is No.</td>
</tr>
<tr>
<td>--AGM</td>
<td>IP address of the AGM.</td>
</tr>
</tbody>
</table>

For a RESTful example of this command and sample output, see `backup` on page 153.
ActAGMDBM.pl Script Template

ActAGMDBM Script Template:
/***********************************************************/
#!/bin/sh
set -x

# echo "create AGM config: One time only at for setting up the config"
# perl ActAGMDBM.pl --type agmconfig --username admin --password password --AGM <AGM IP>

# for setting up the backup
echo "********** starting the backup **************"
perl ActAGMDBM.pl --type backup --dbname <source db name> --hostname <source host name under CDS> --backuptype <db or log or dblog> --backuplabel <backup bookmark label> --CDS <CDSIP> --wait <yes|no>
if [ $? -gt 0 ]; then
    echo "********** error backingup database ***************"
    exit 1;
fi
    echo "********** end backup **************"

    echo "*********** start list image details *************"
    perl actAGMDBM.pl --type listImageDetails --appname <application name> --hostname <source hostname> --AGM <AGM name|ip>
    if [ $? -gt 0 ]; then
